

AIM

To create public and private keys using kleopatra

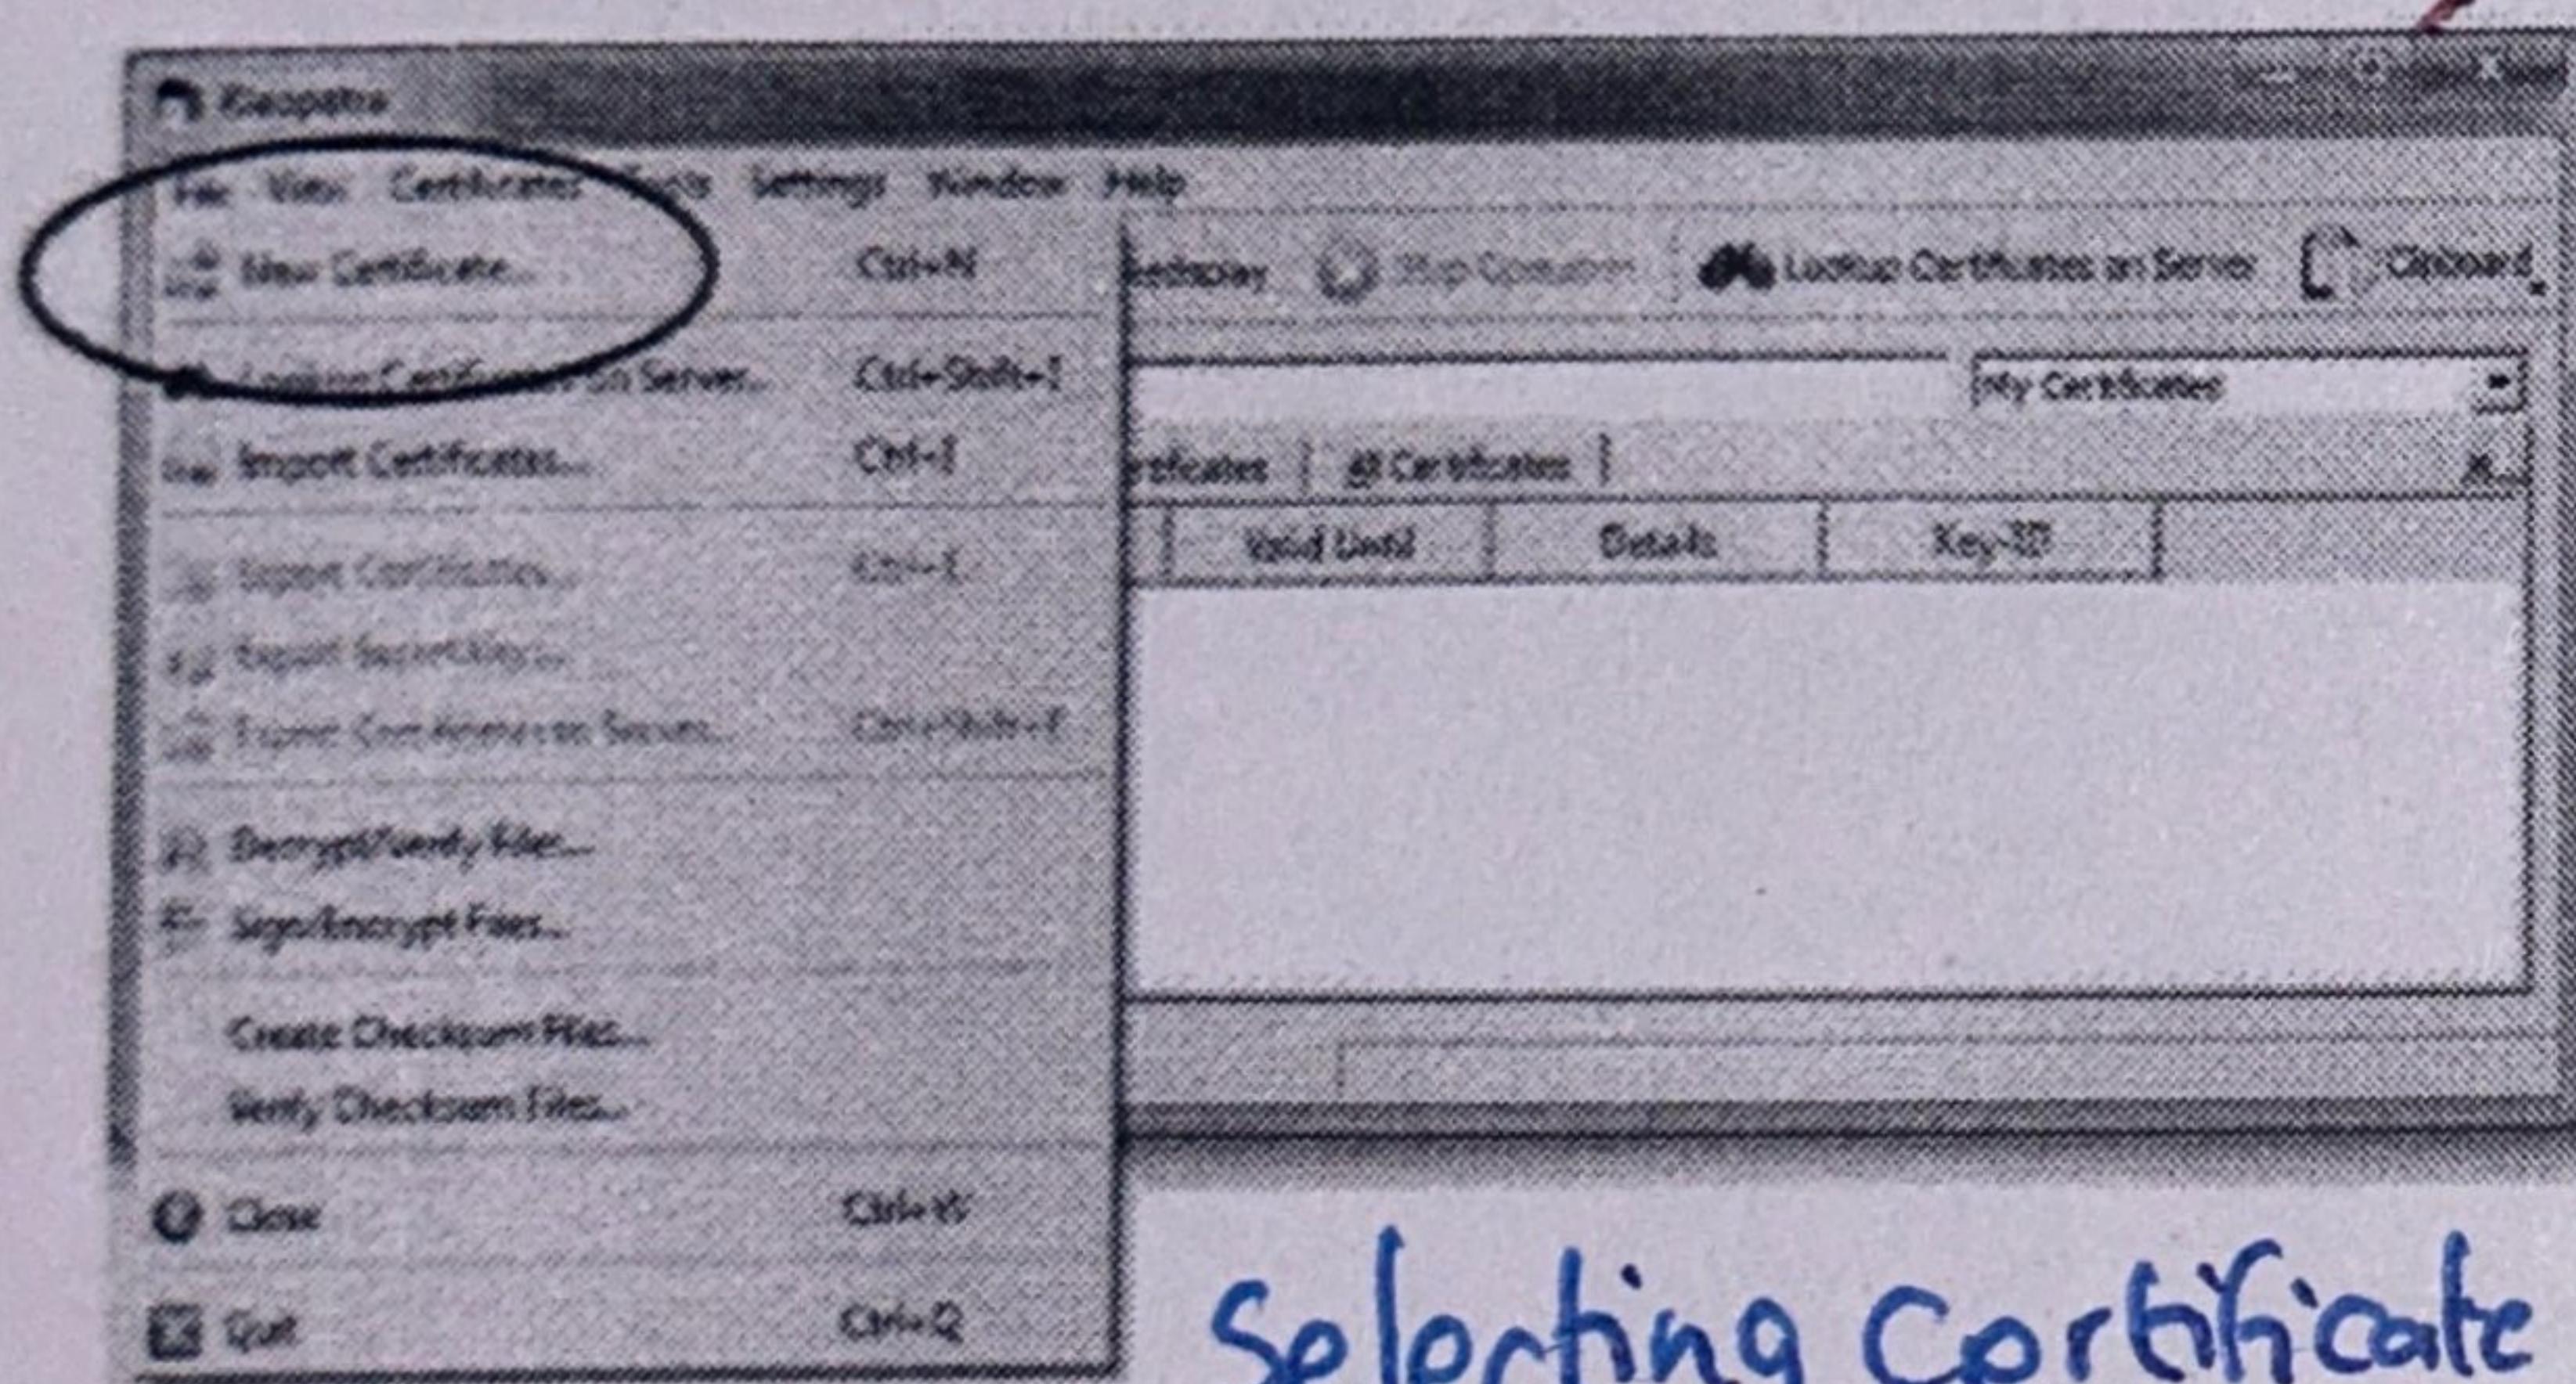

Procedure

- 1) Install kleopatra and start the kleopatra management software
- 2) GUI will be displayed.
- 3) From file drop down, click on new certificate option.
- 4) Click on "create a personal OpenPGP key pair and next button." 
- 5) Certificate wizard will start & display.
- 6) Enter name & email id
Enter optional comment if required.
- 7) Review extended values if OK, create the key.
- 8) Passphrase will be asked, create ie enter it.
- 9) Passphrase should follow strong password standards 
- 10) Reenter passphrase and click ok
- 11) Once certificate is created, backup of keys will be displayed

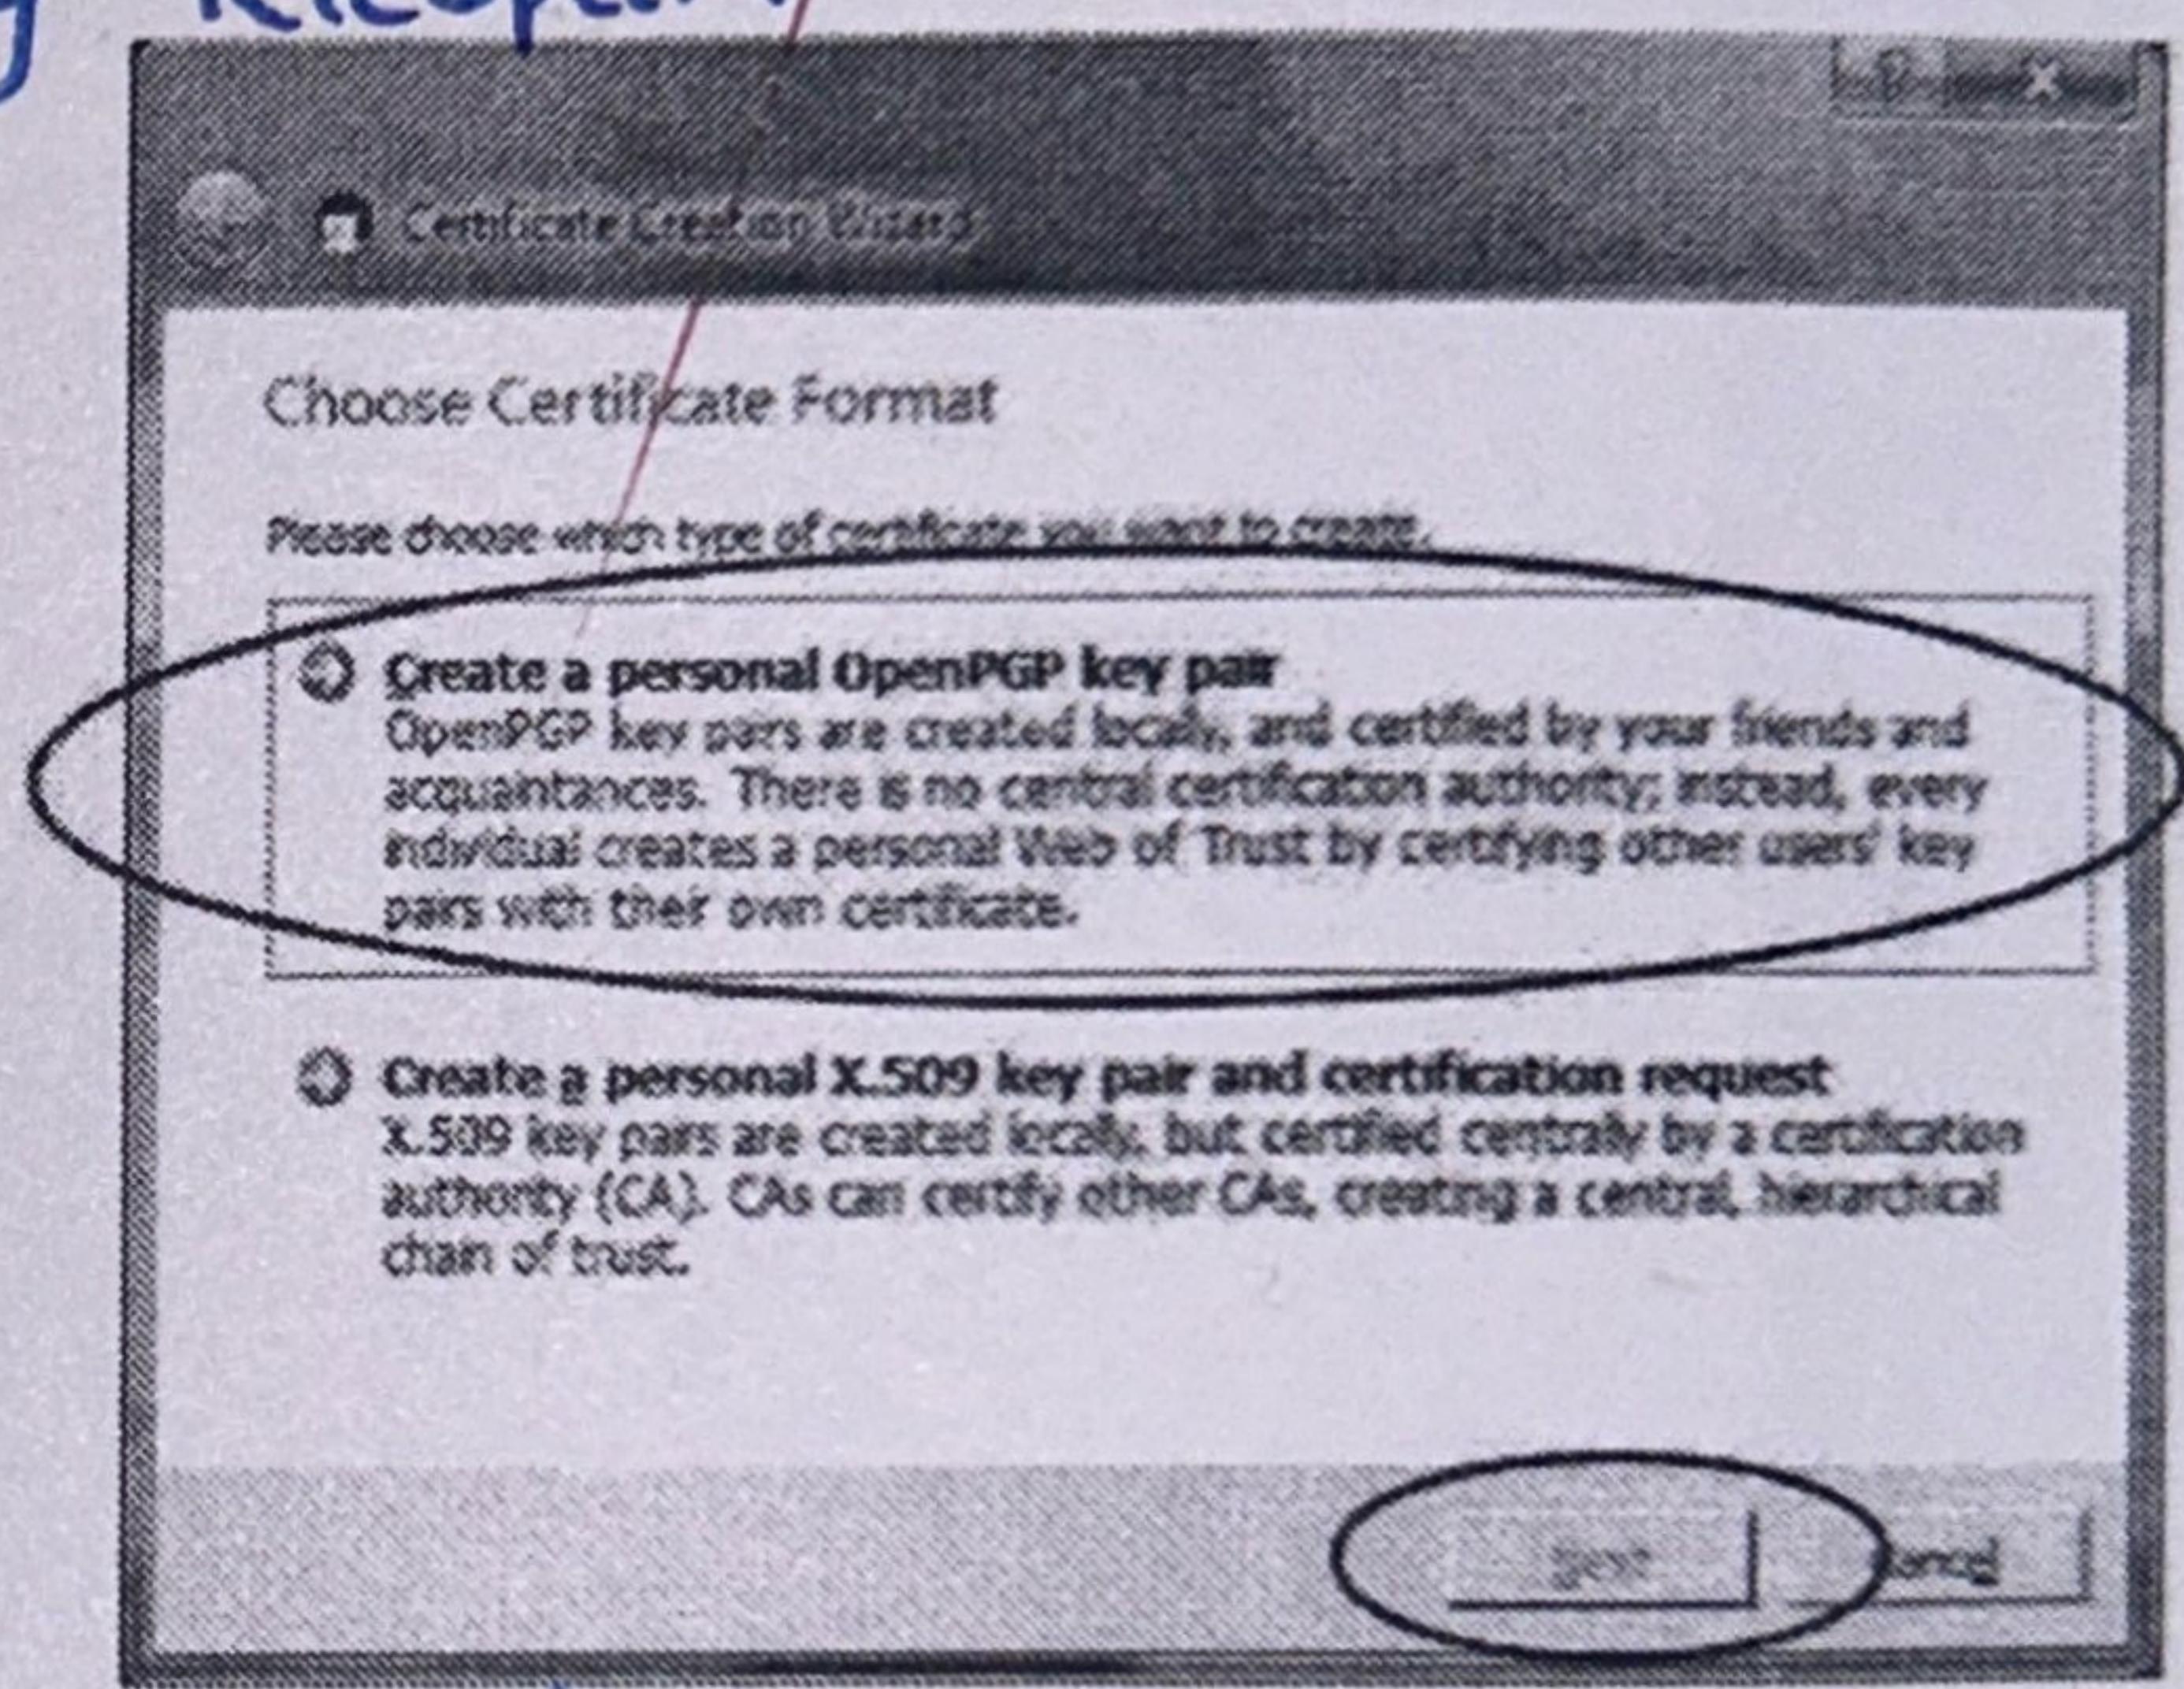

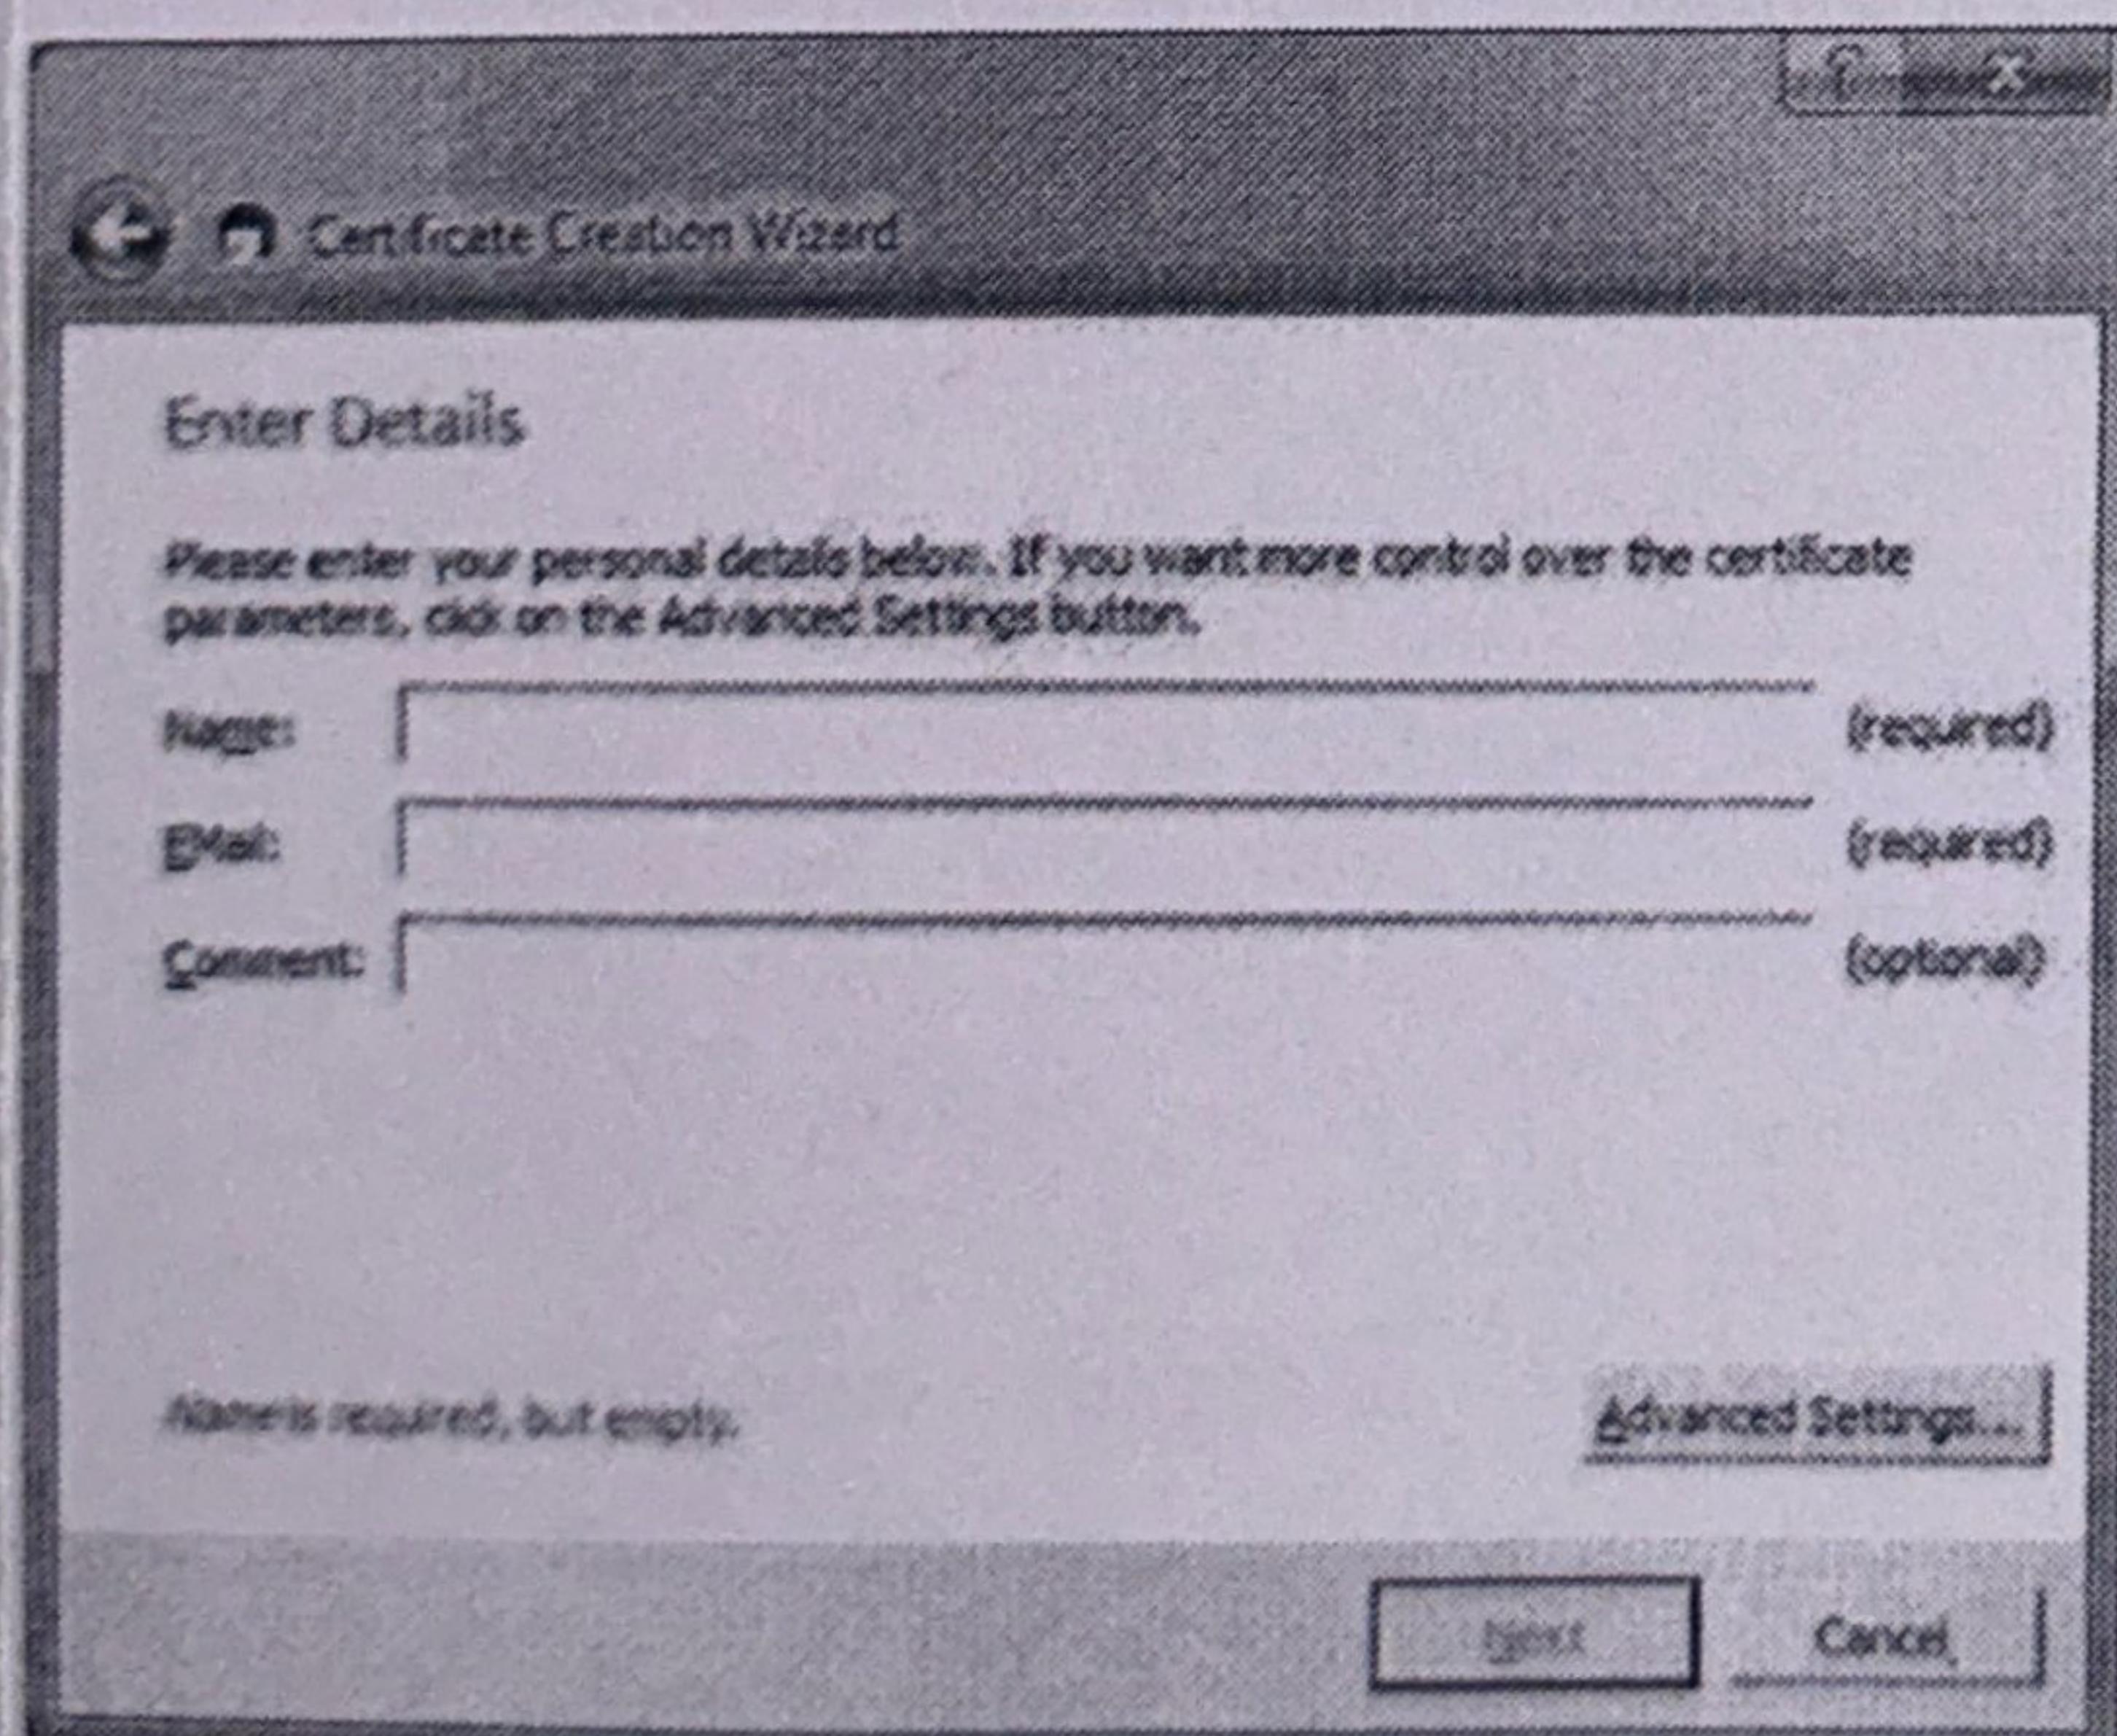

1) entering Kleopatra

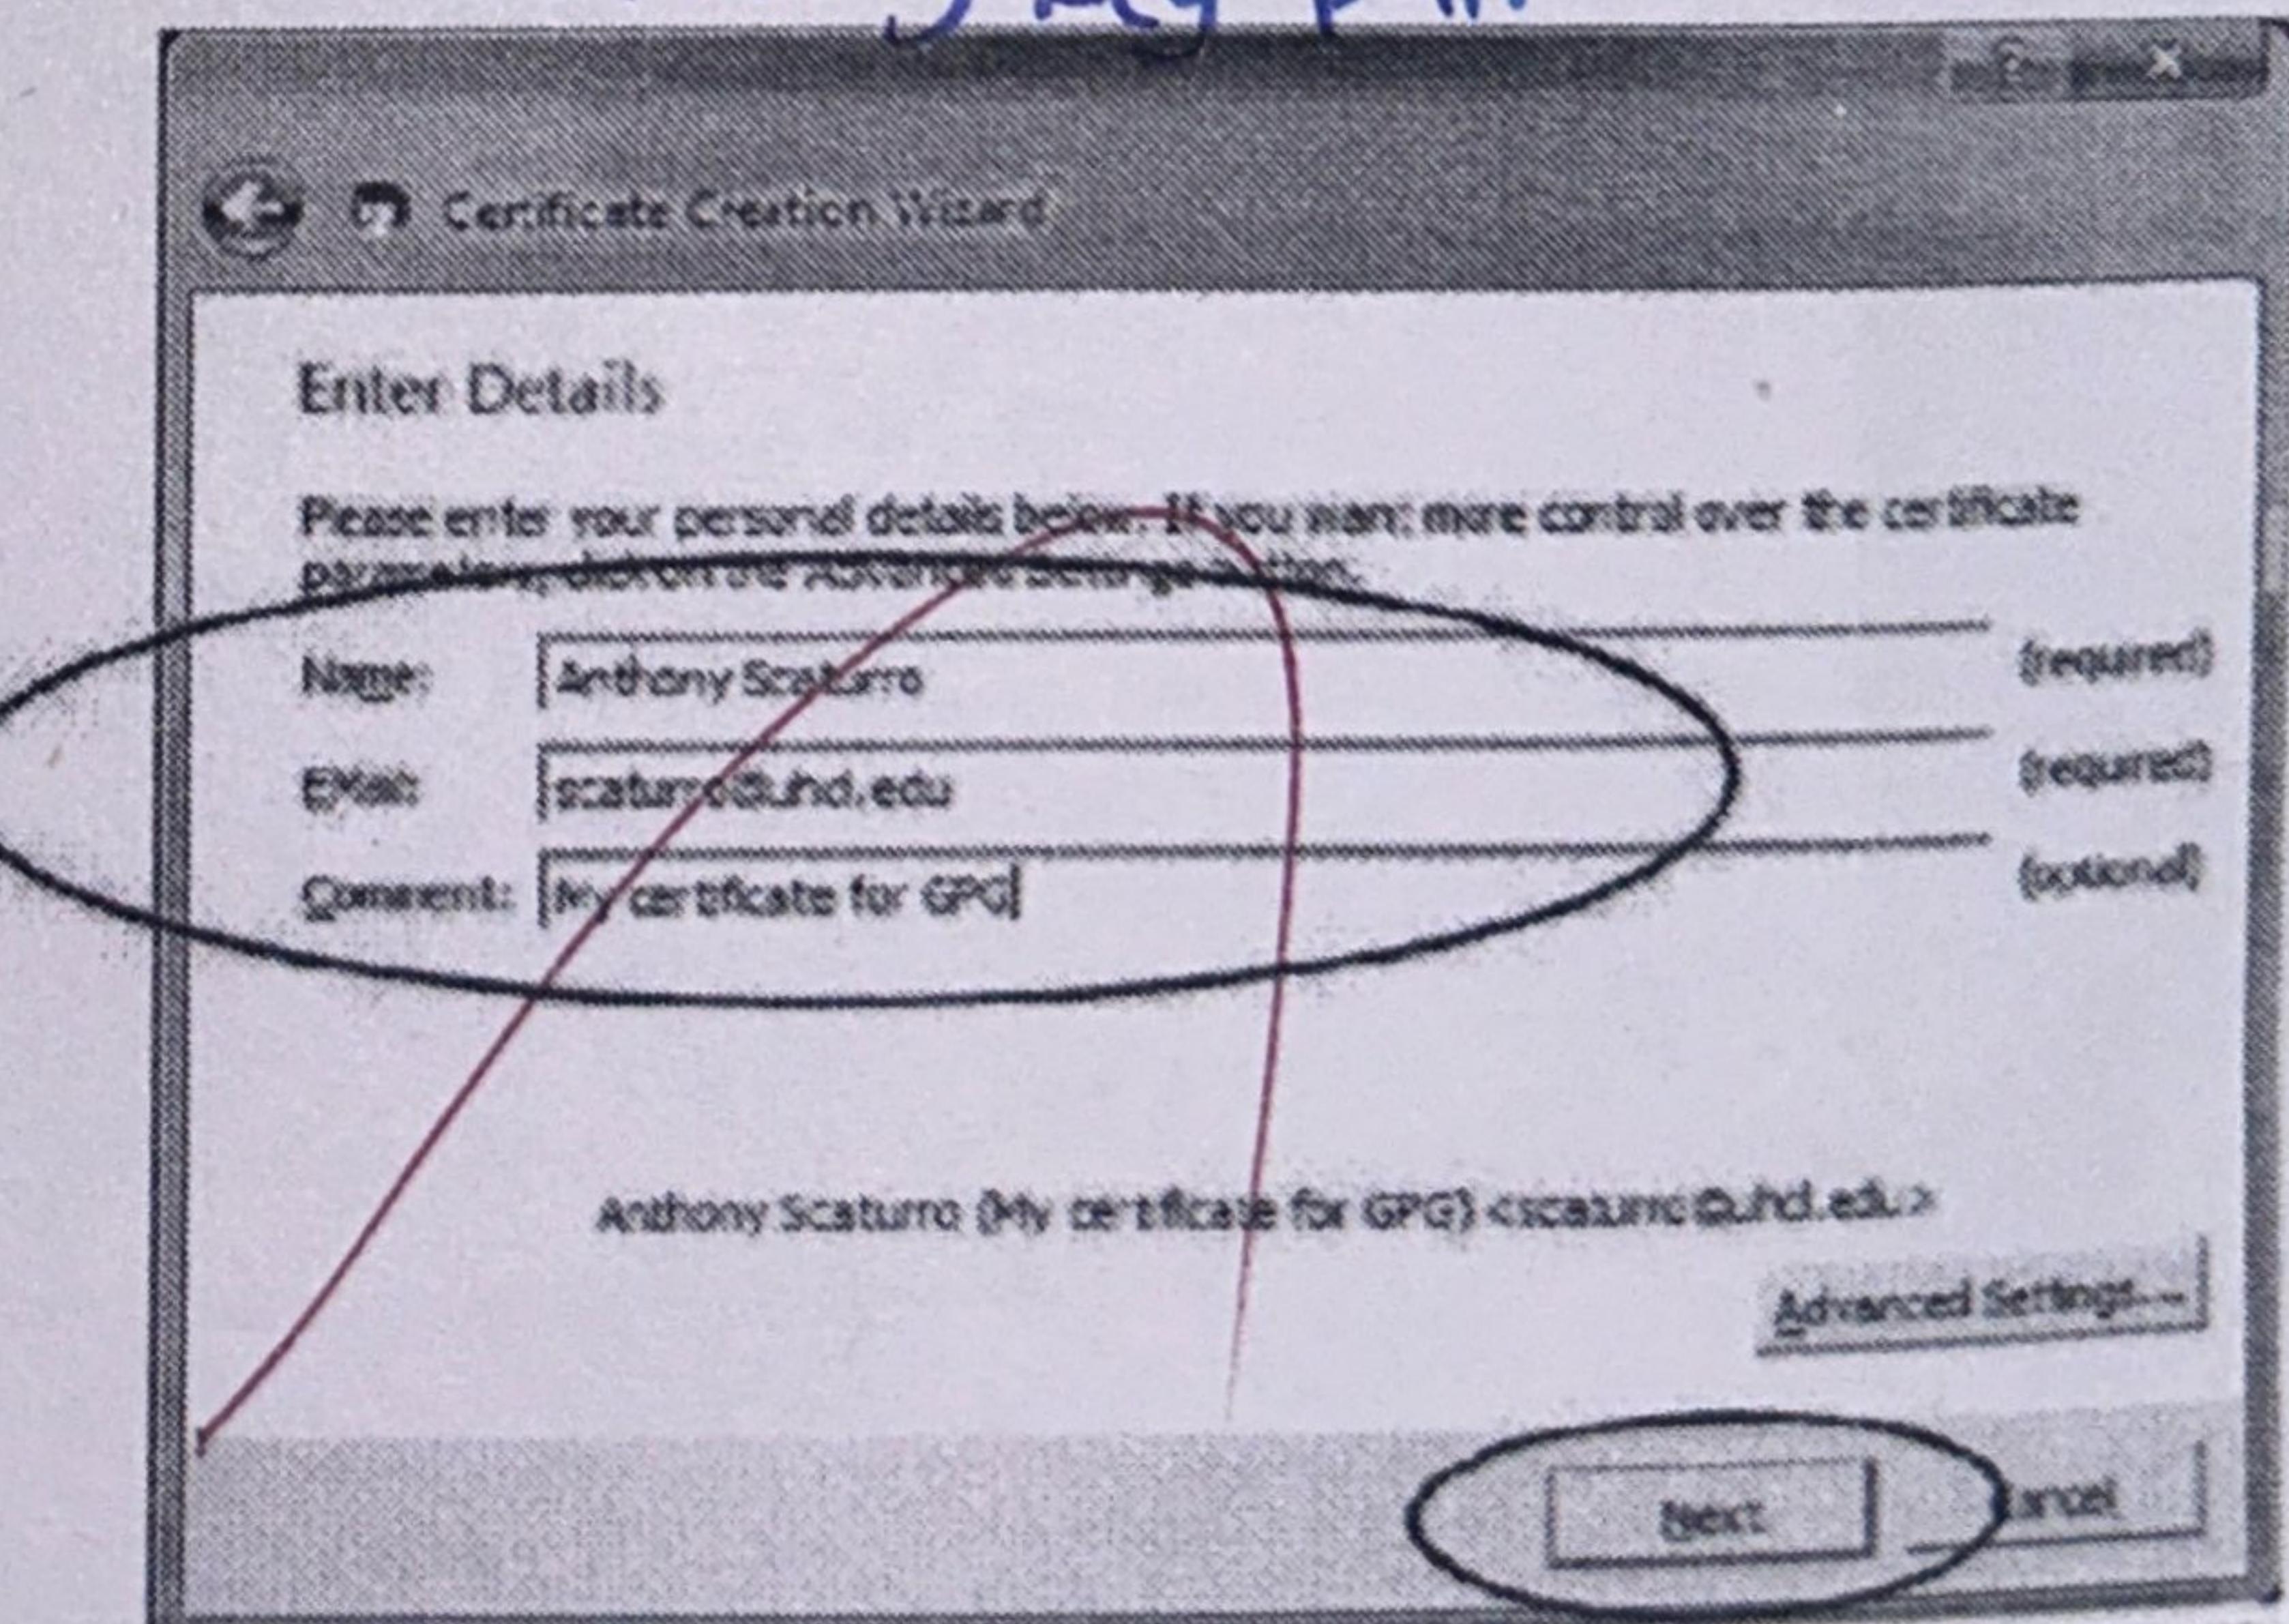

Selecting Certificate

Creating key pair

Certificate input

(1) name

backup & export

12)

You may backup key pair in folder of choice or skip it

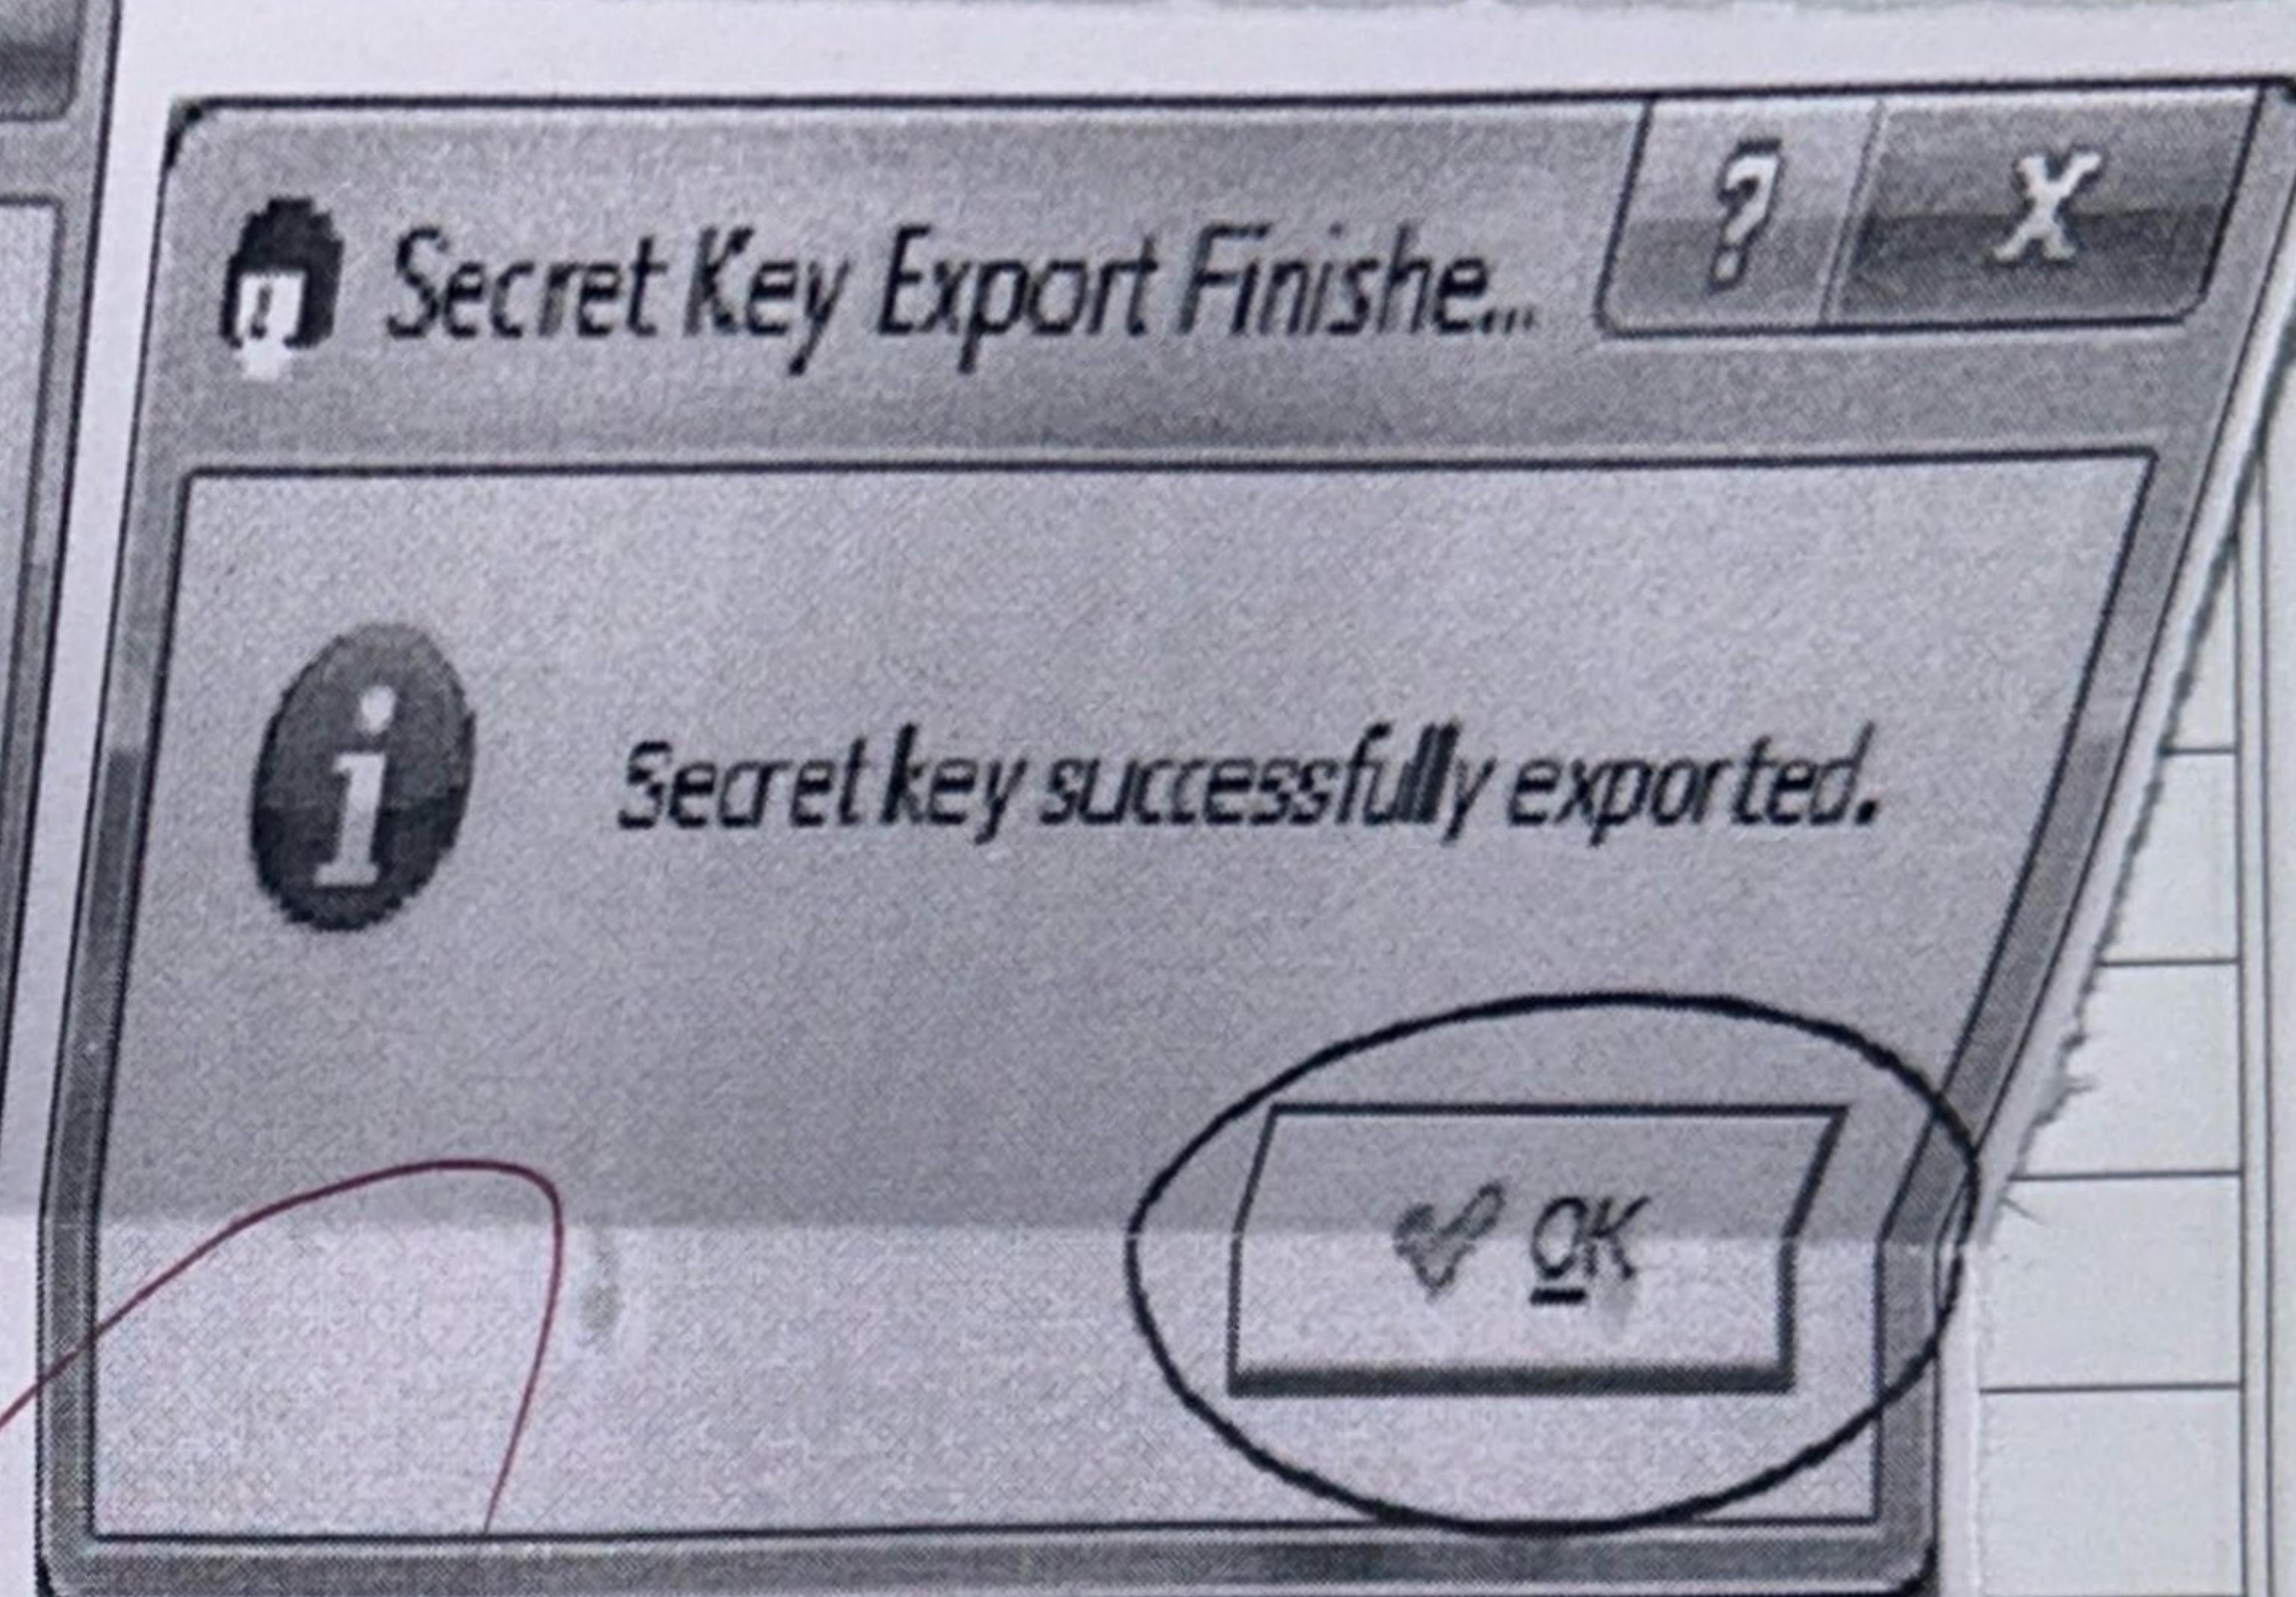

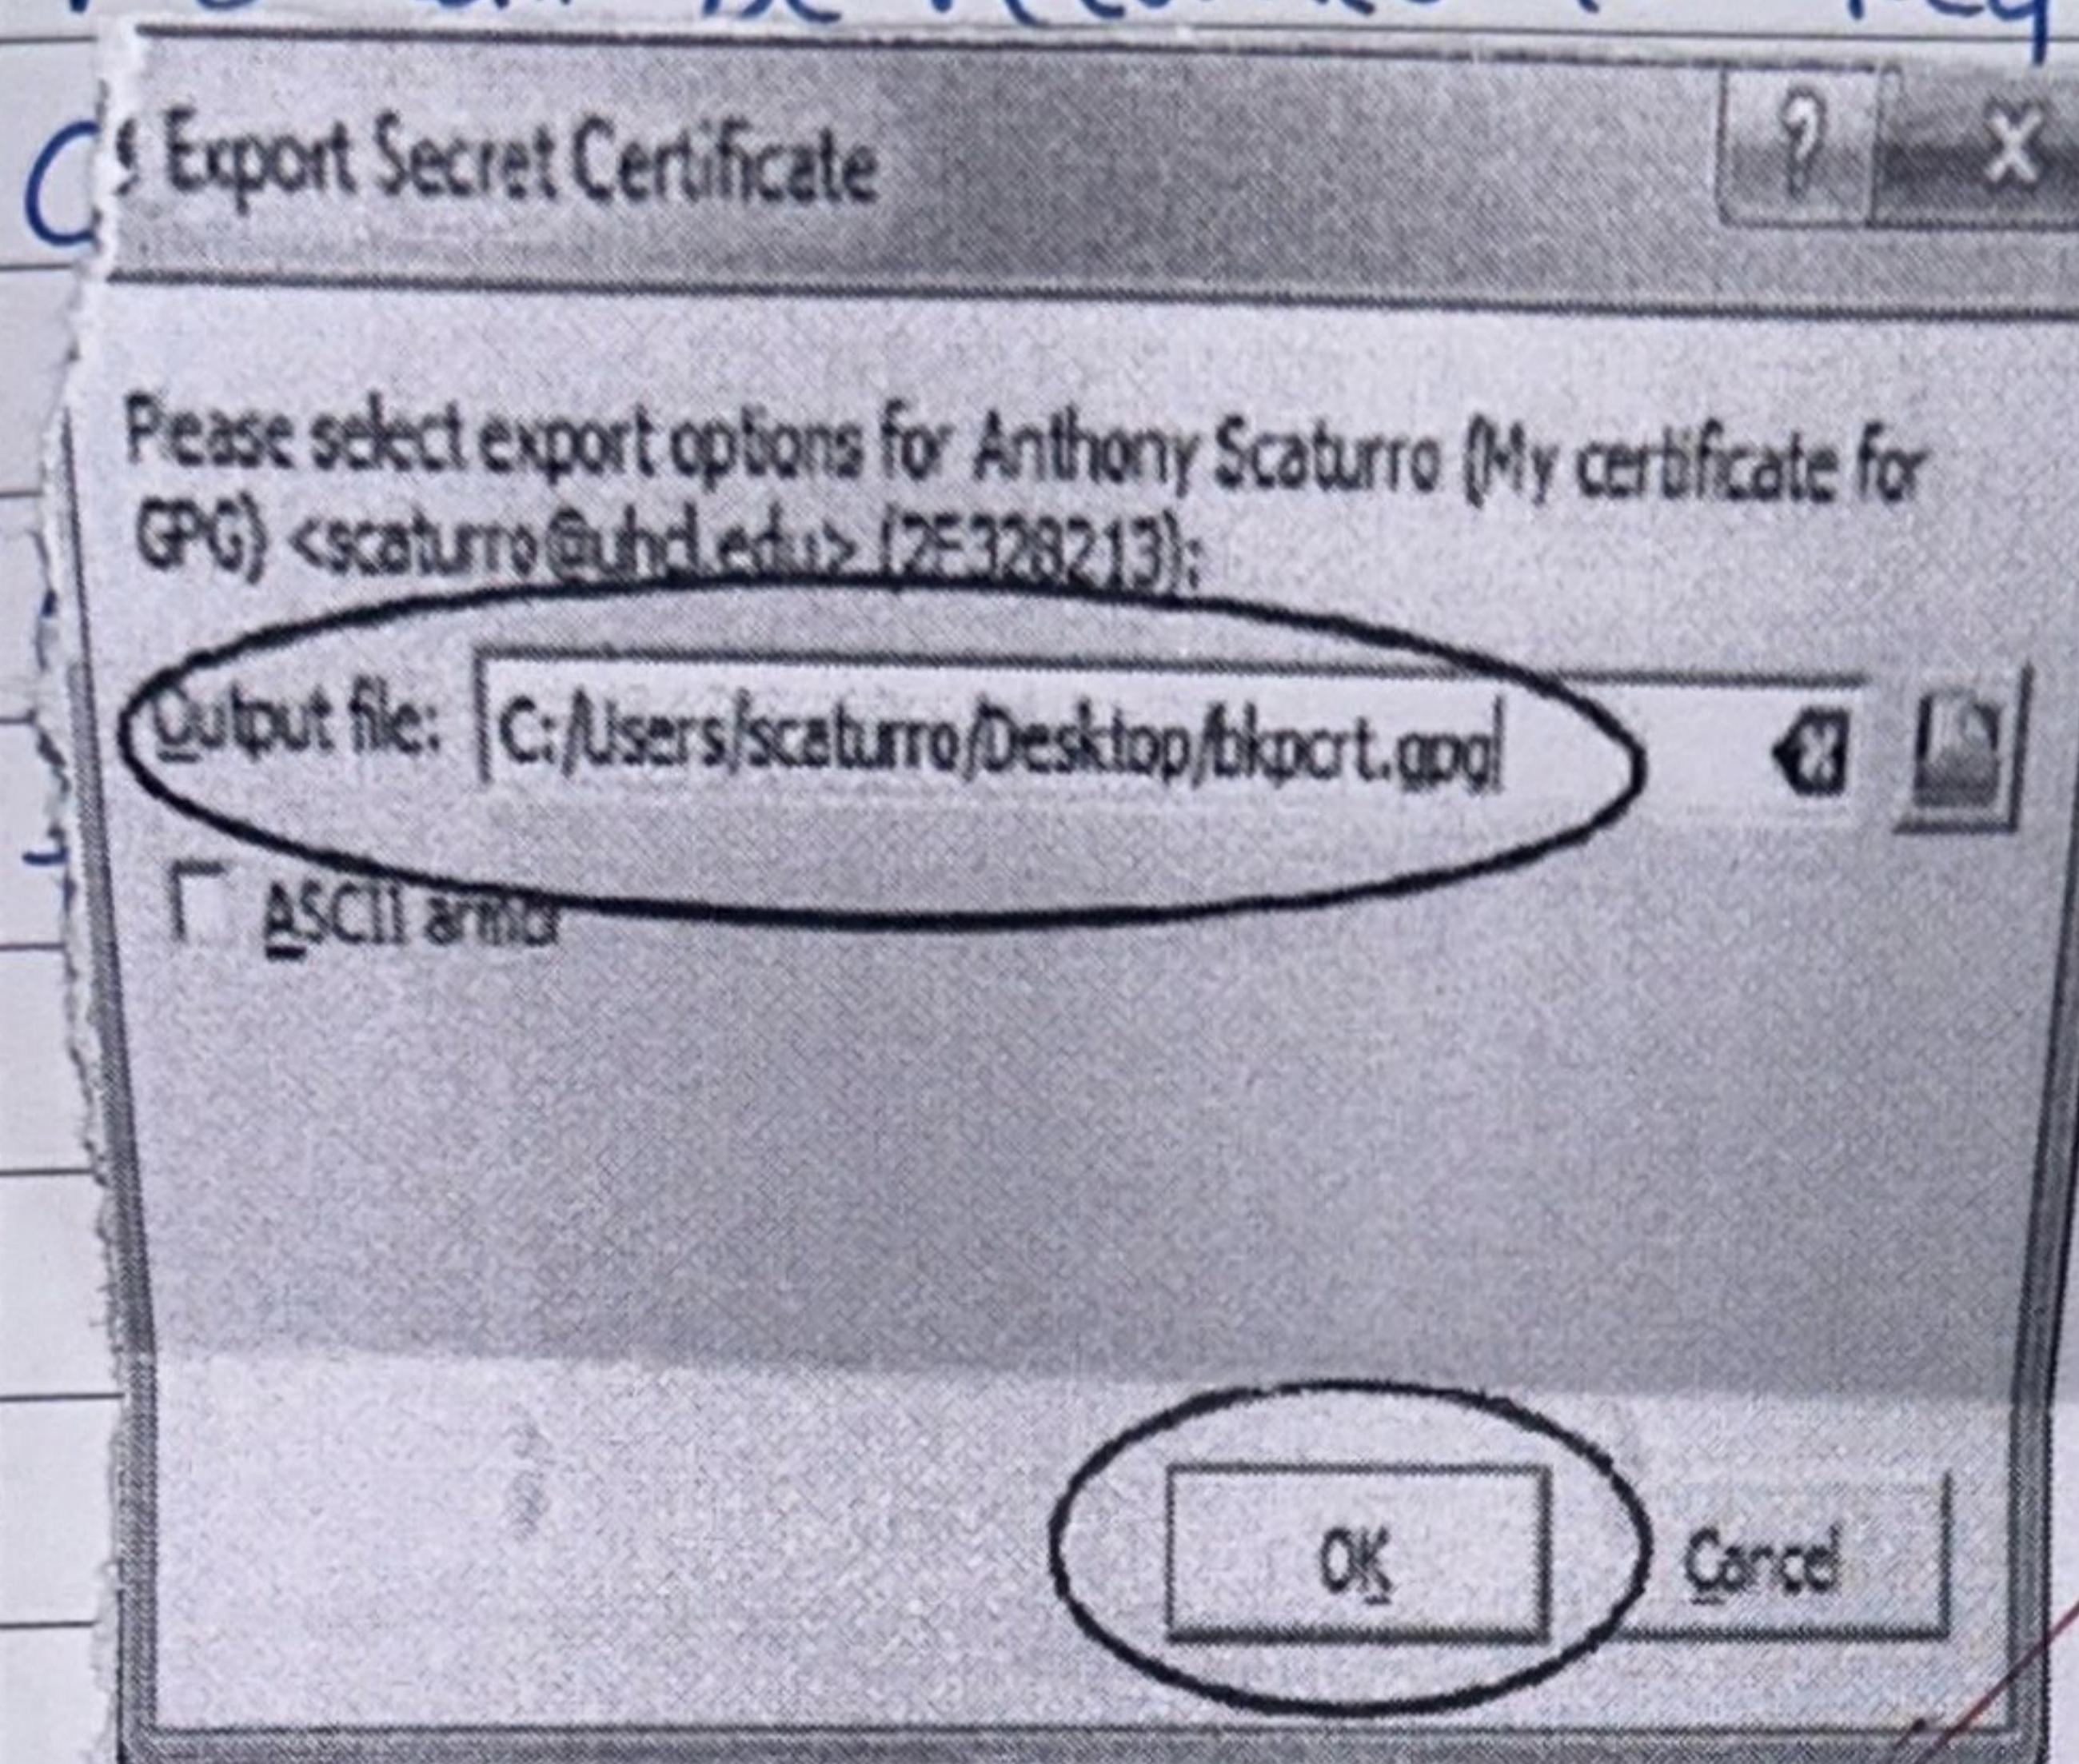

13)

After key is exported, it will be displayed, click ok

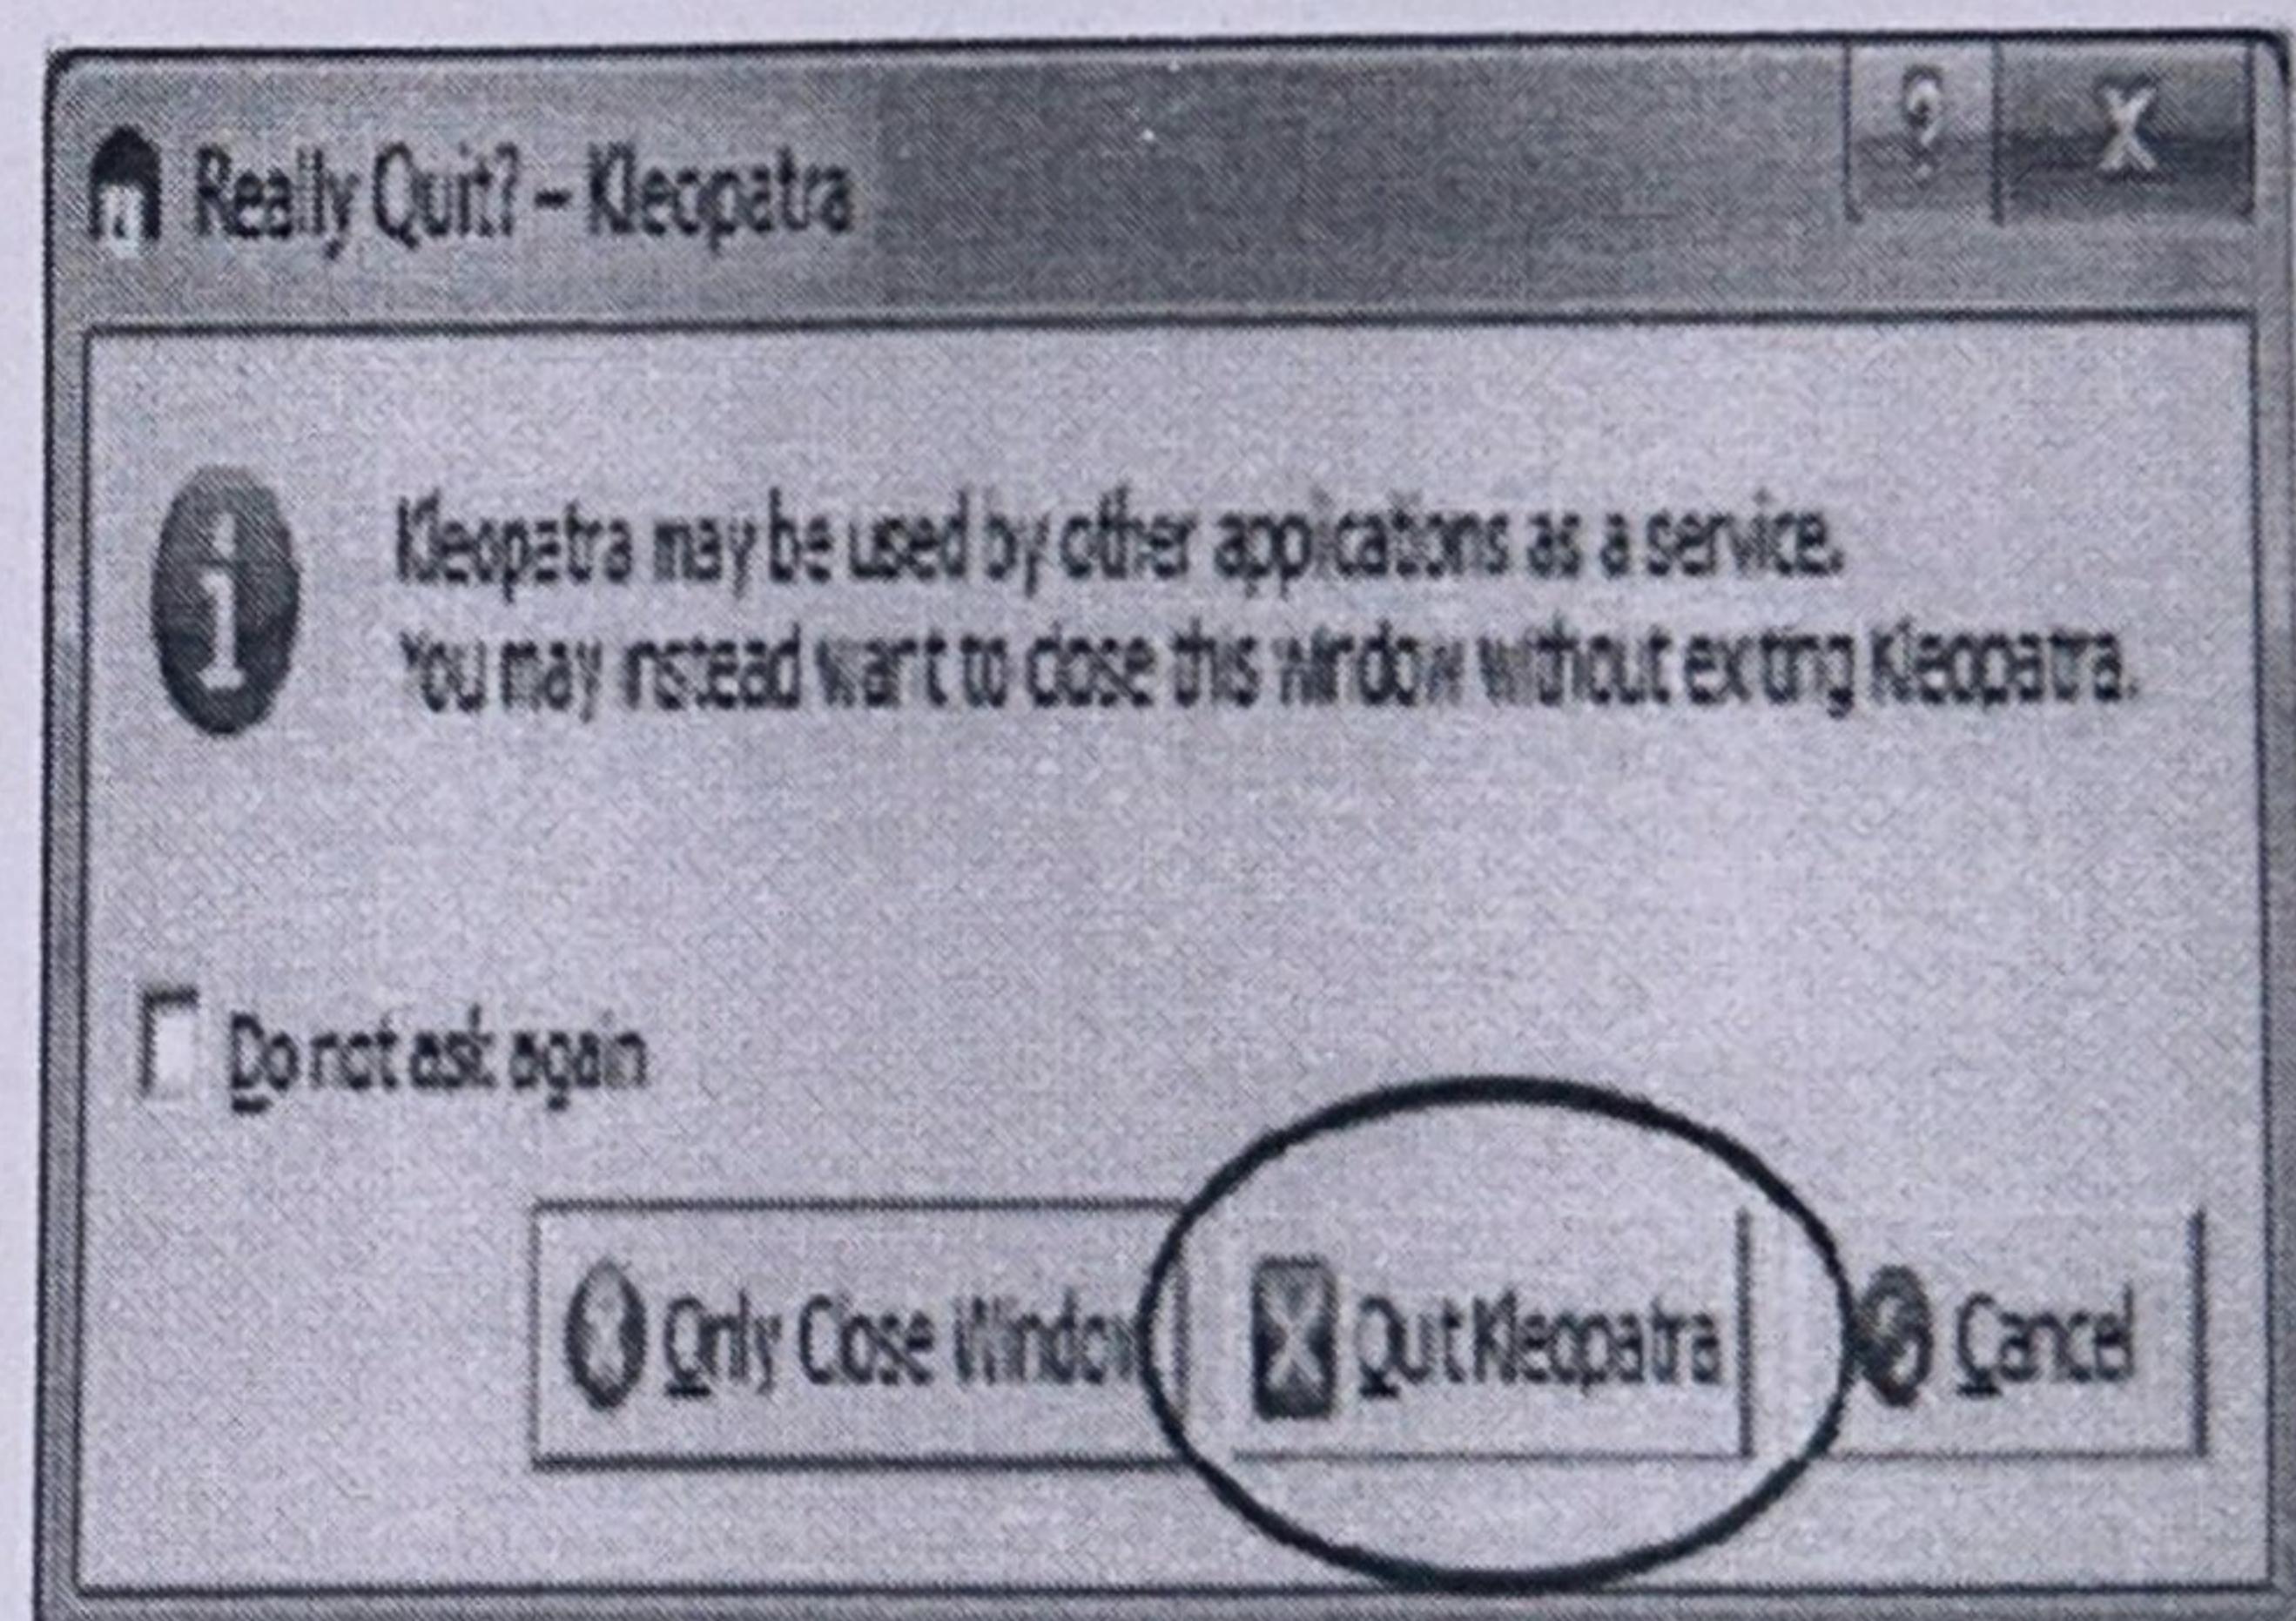

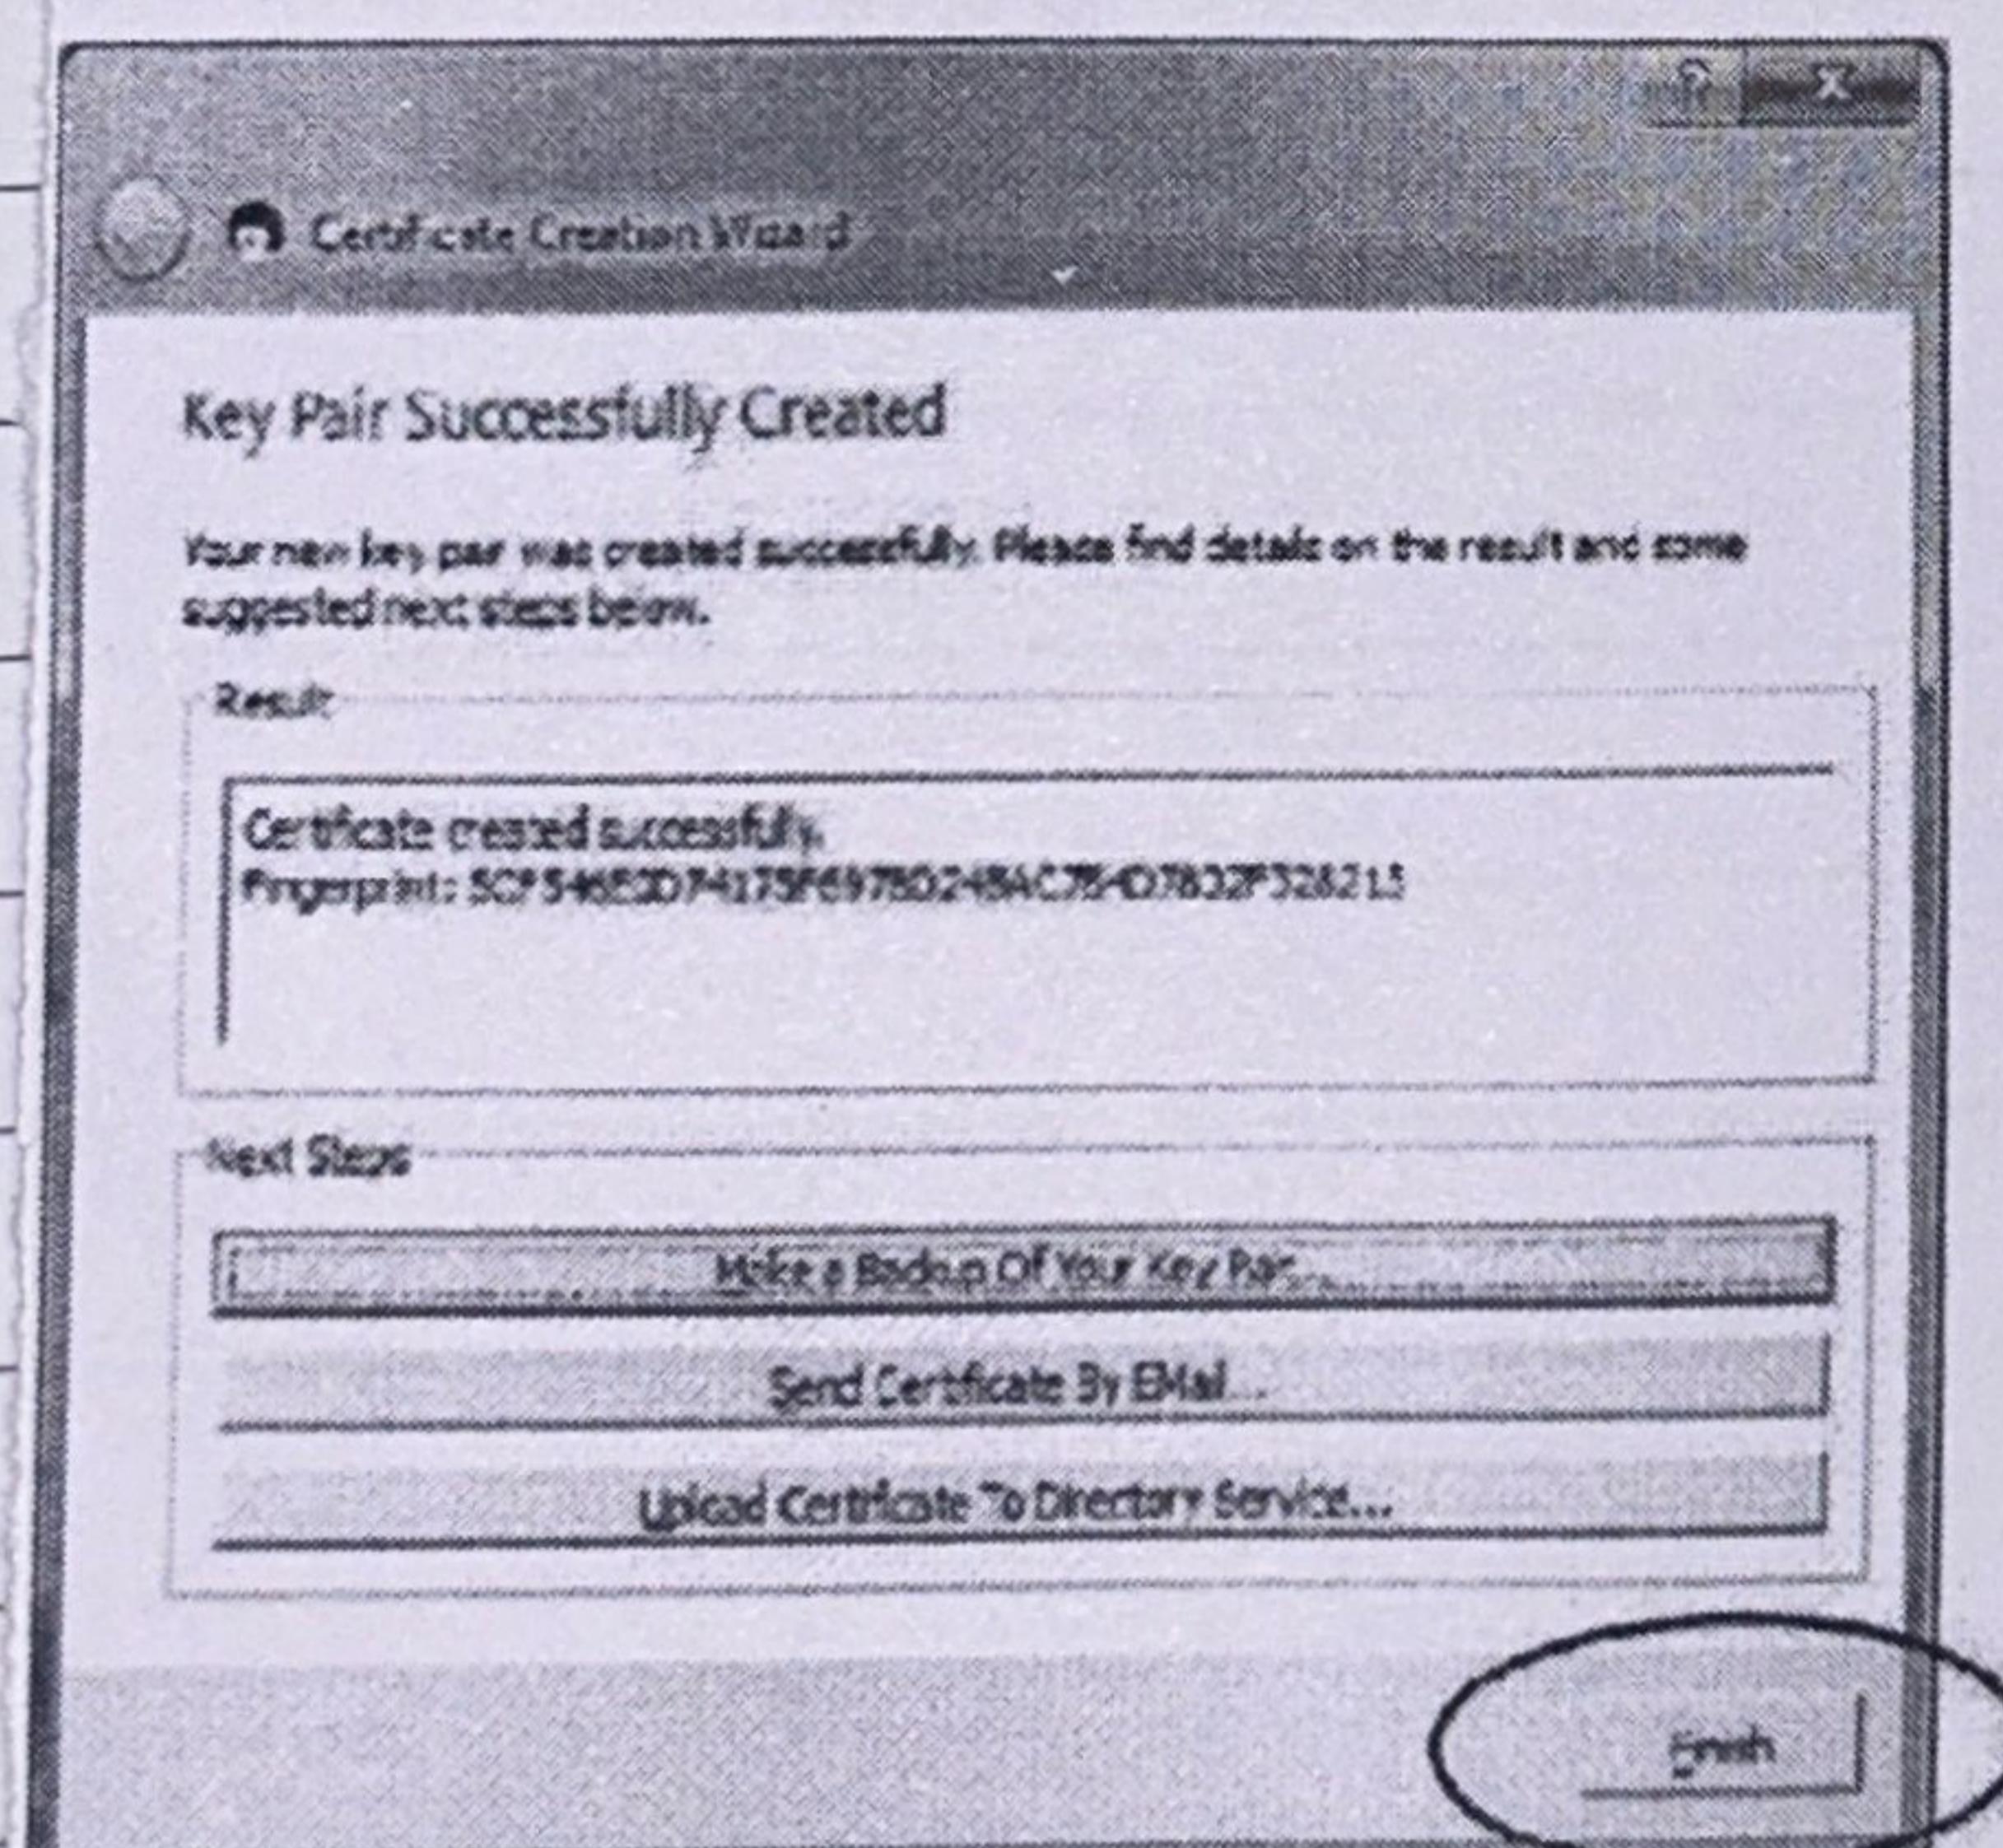

14)

You will be returned to key pair created successfully

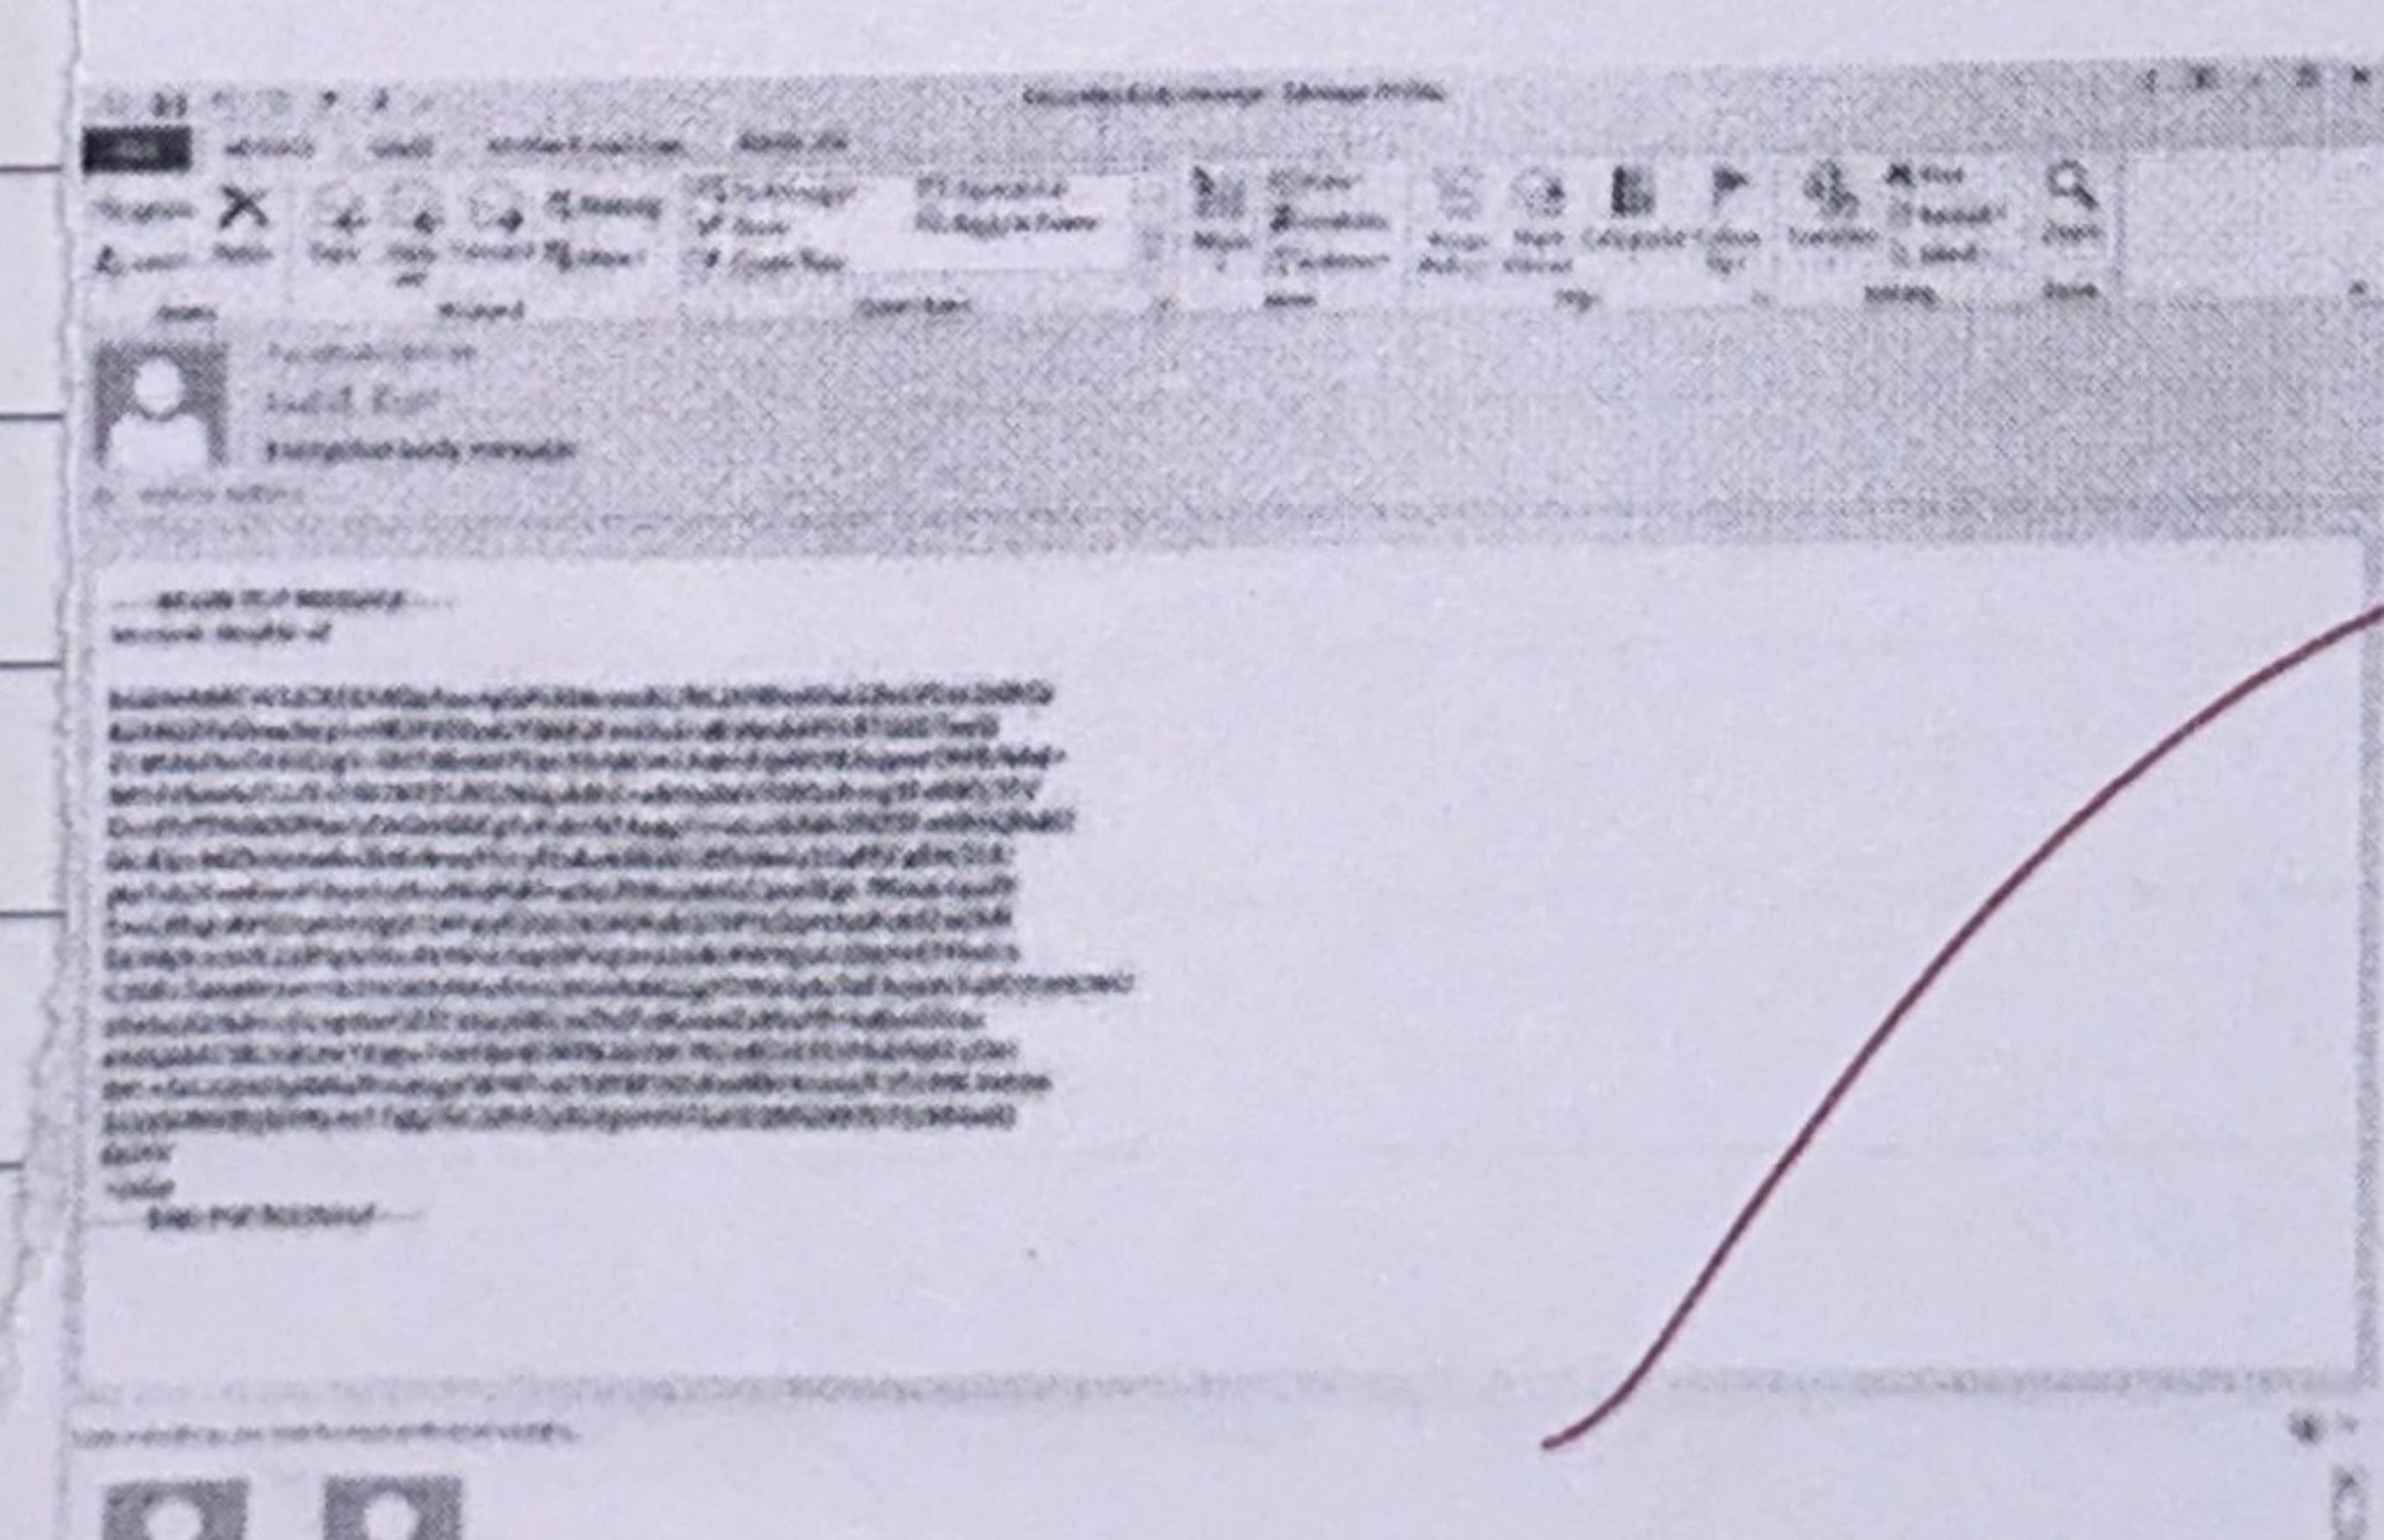

15)

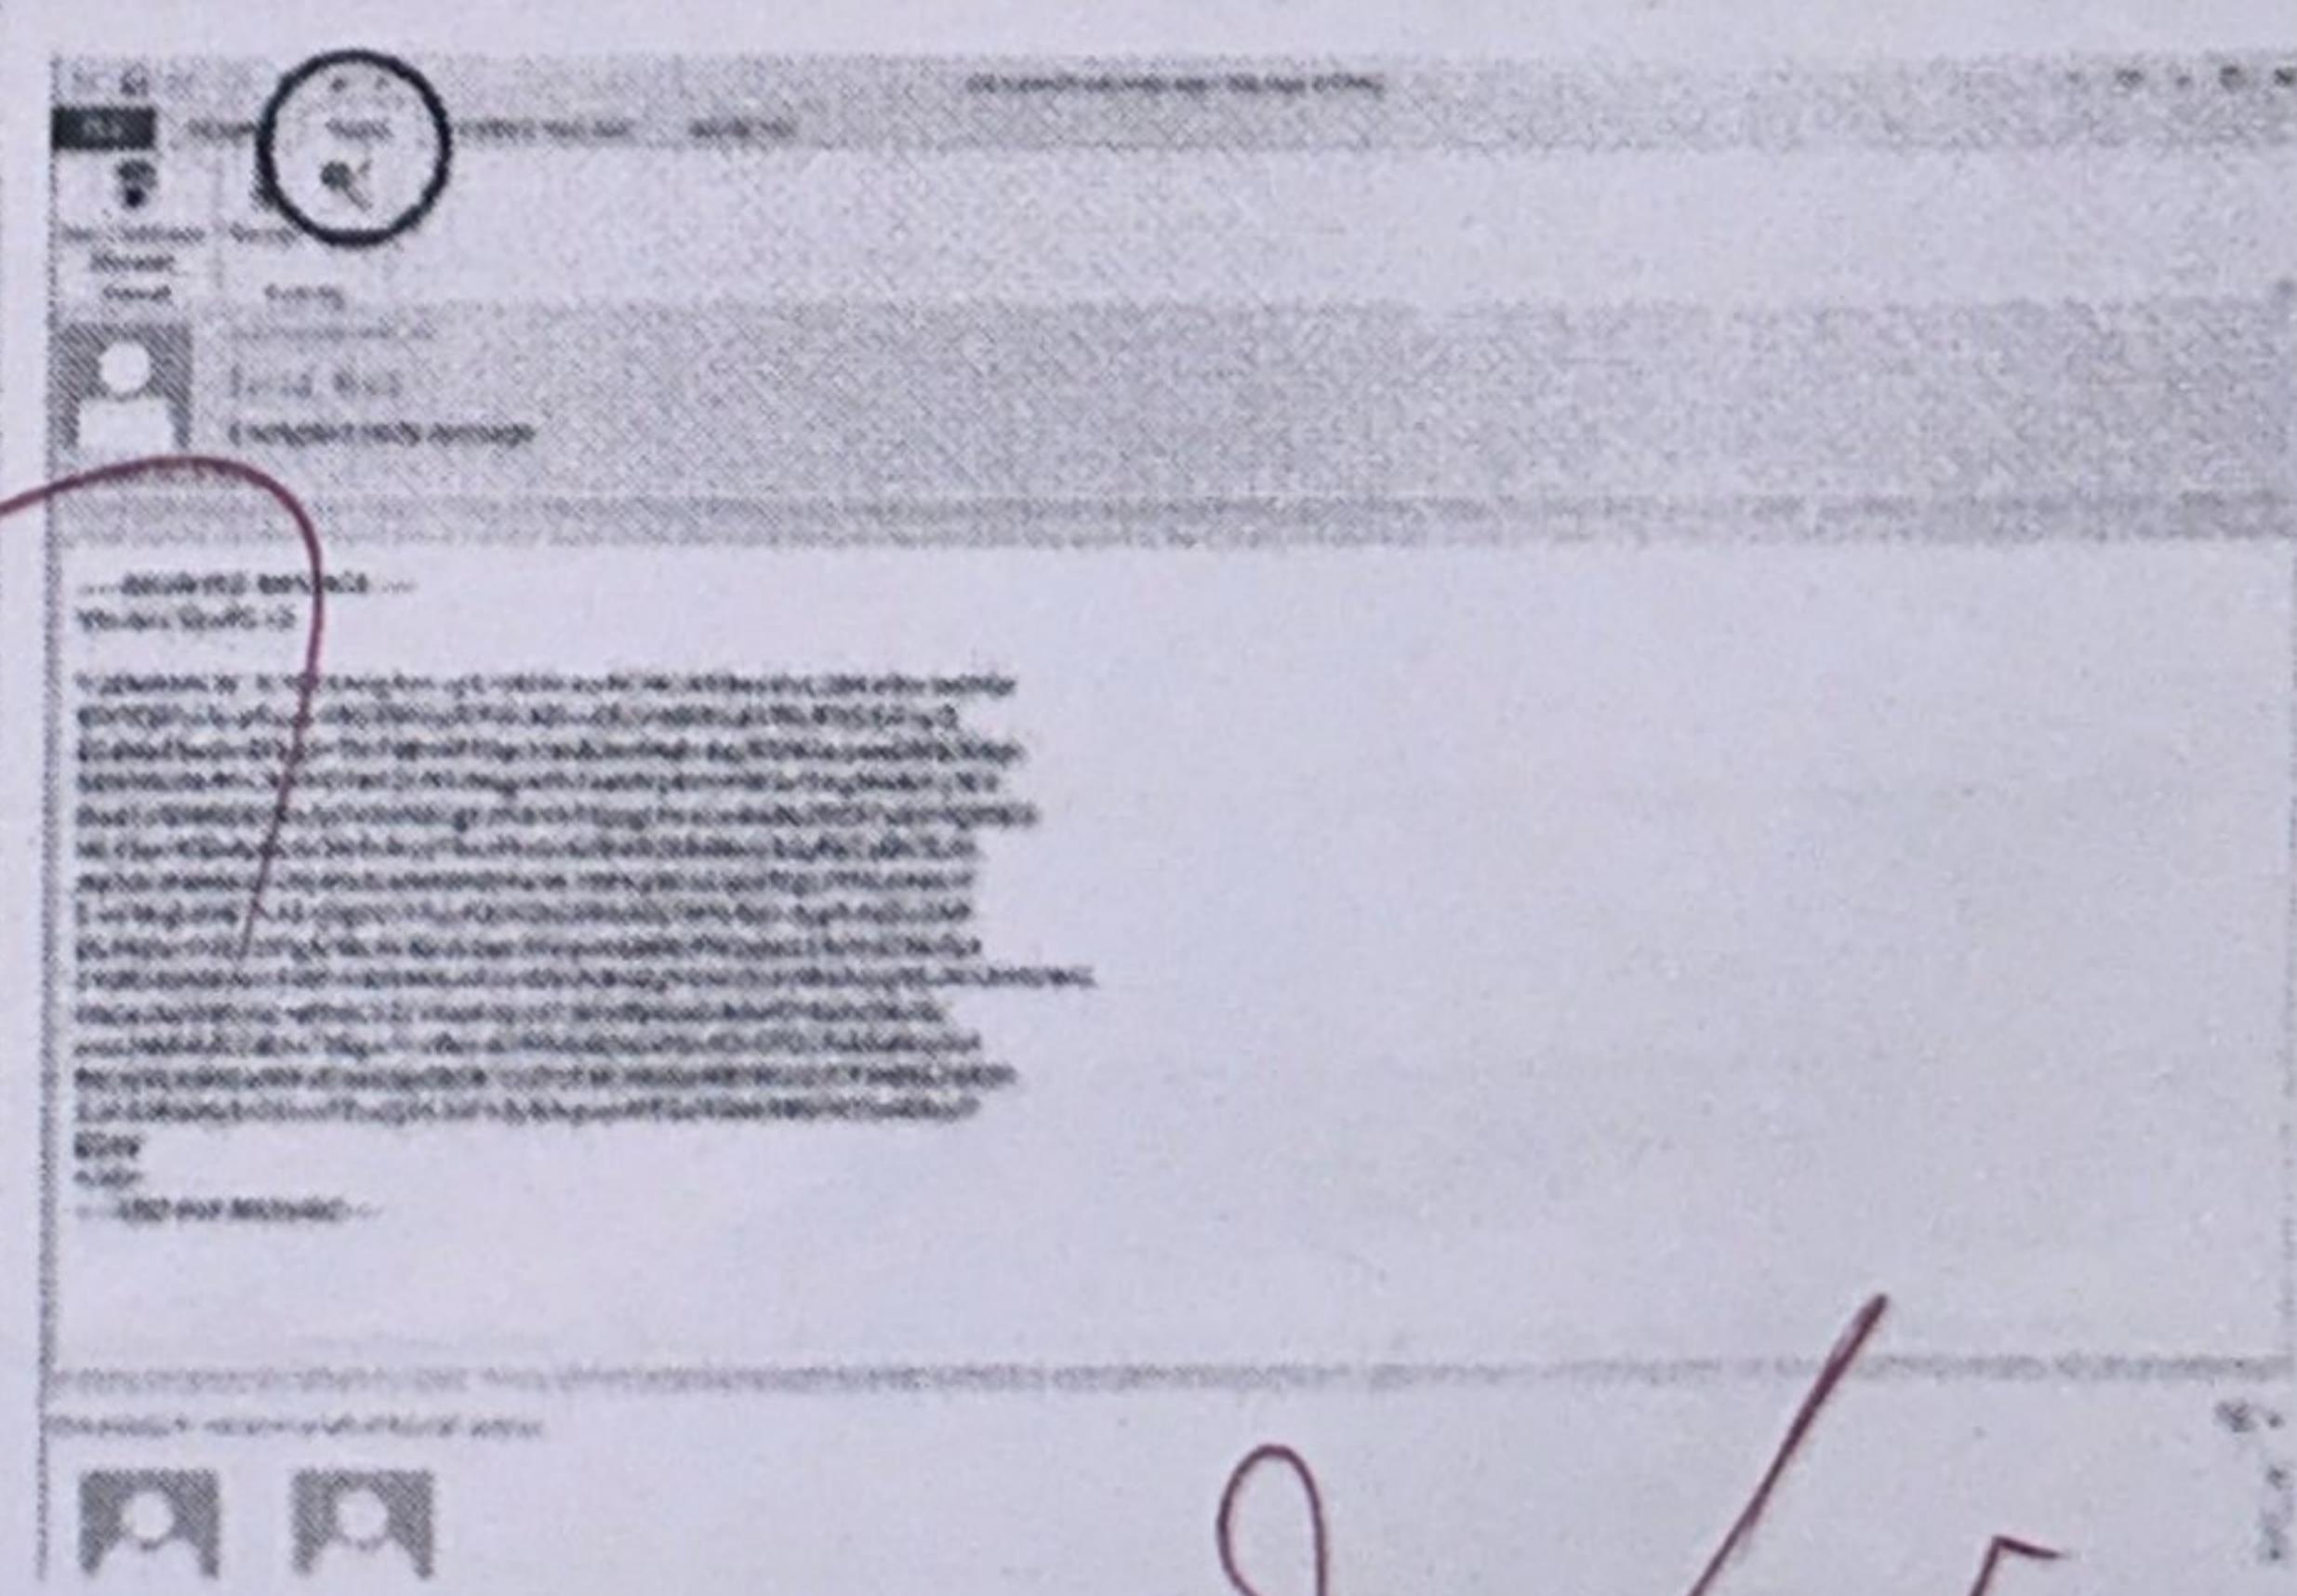

exporting ↑

Quit Software ↑

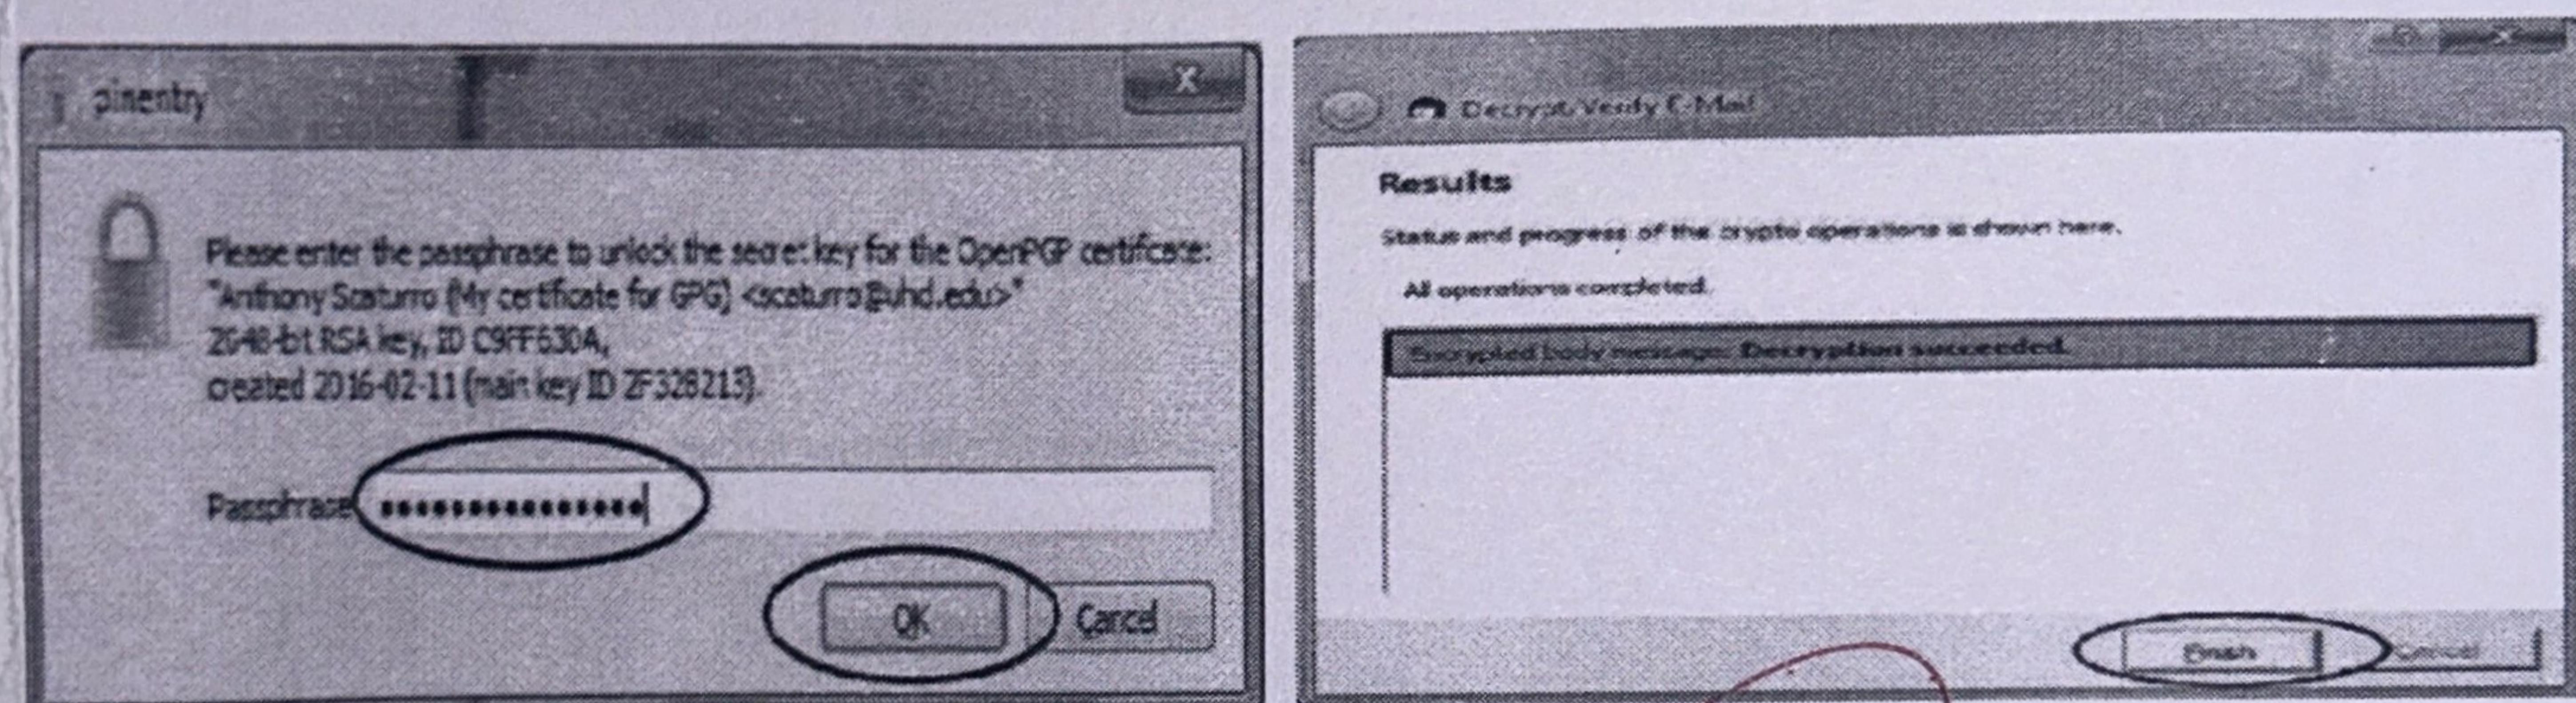

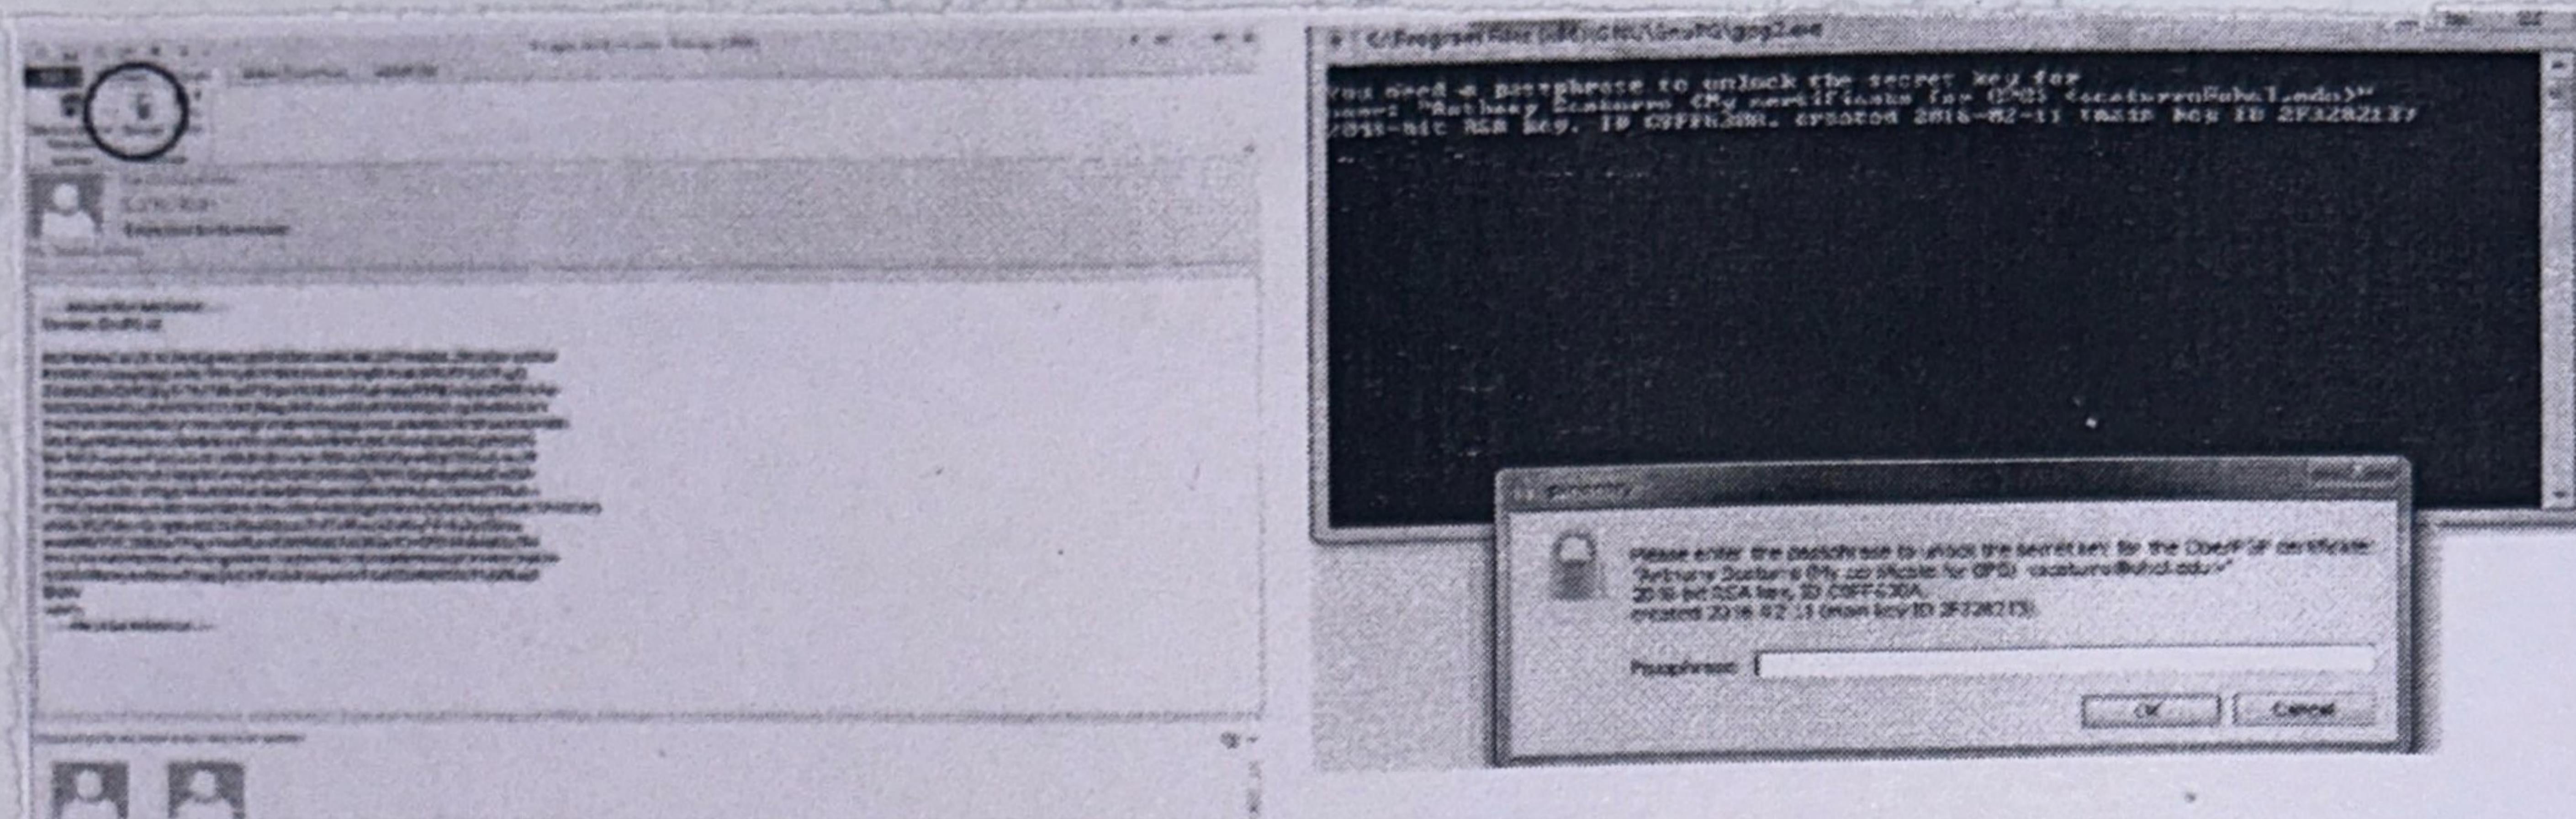

GPG tab

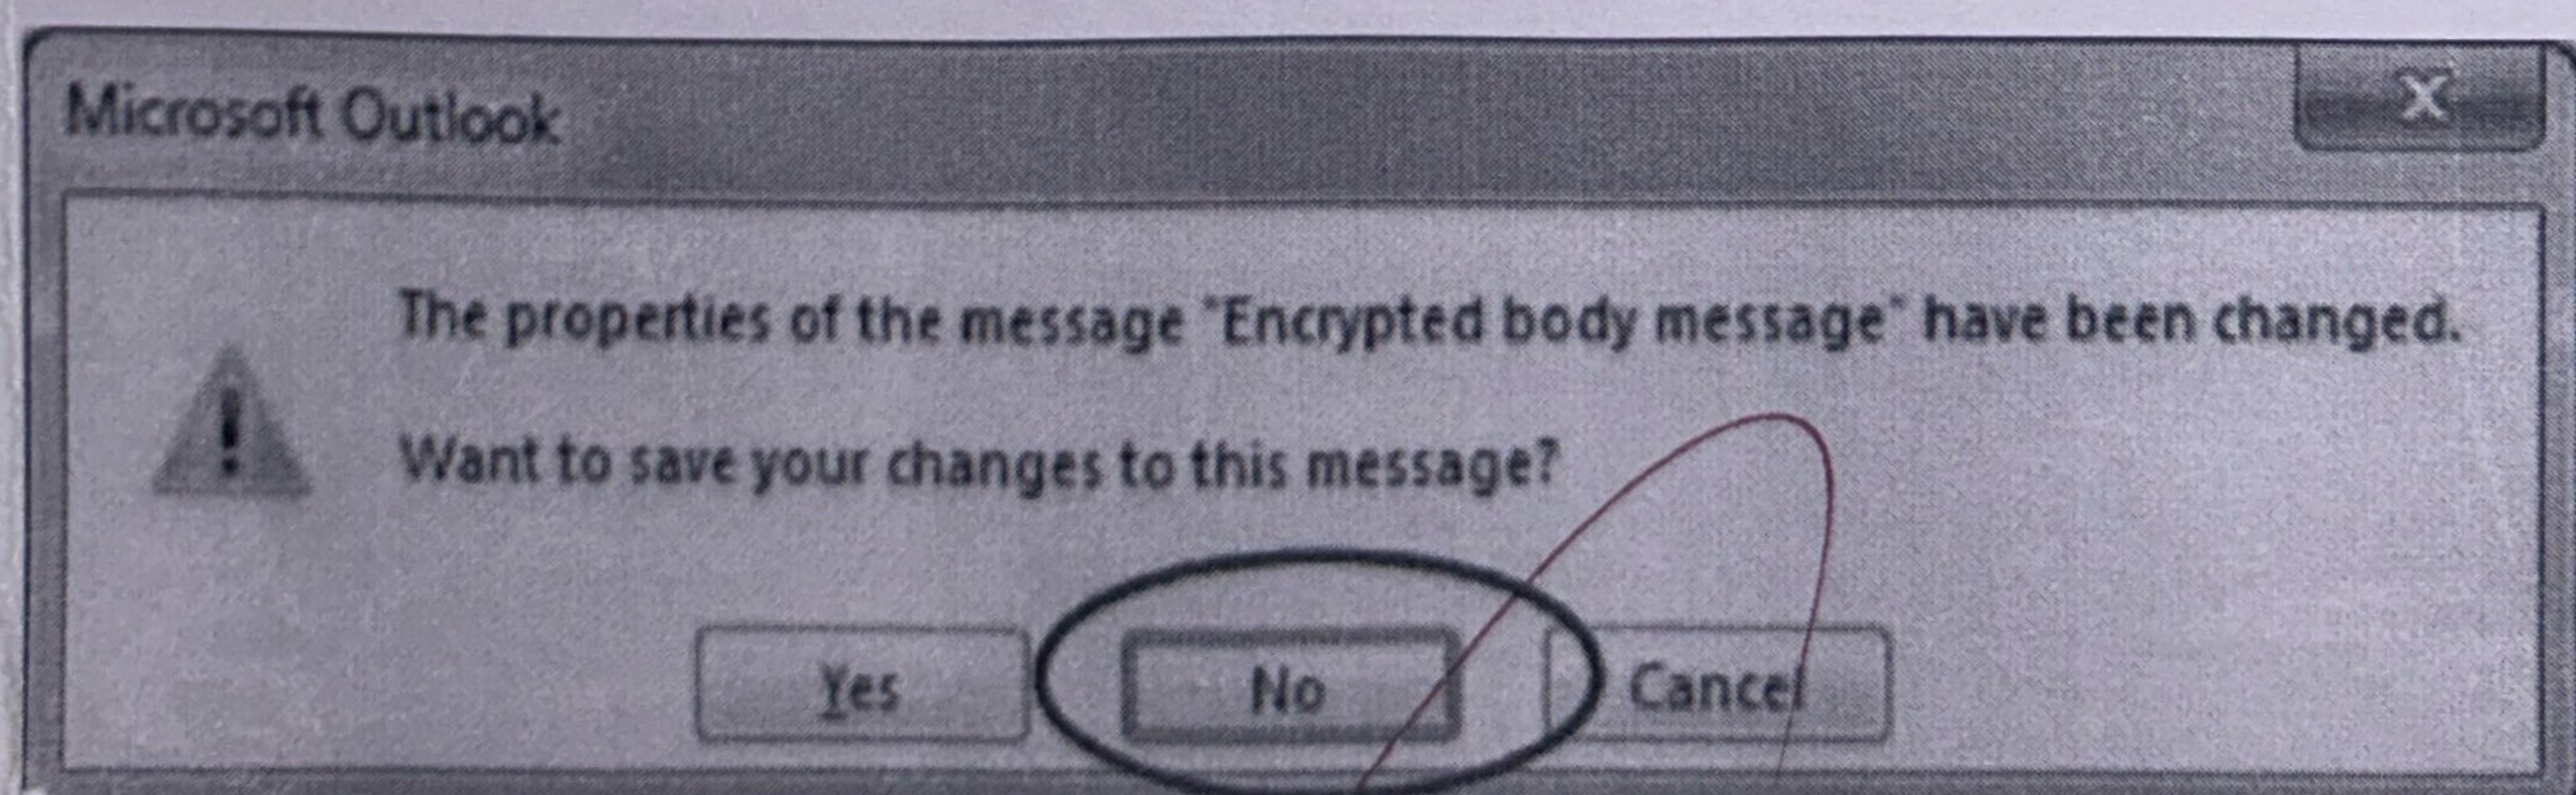

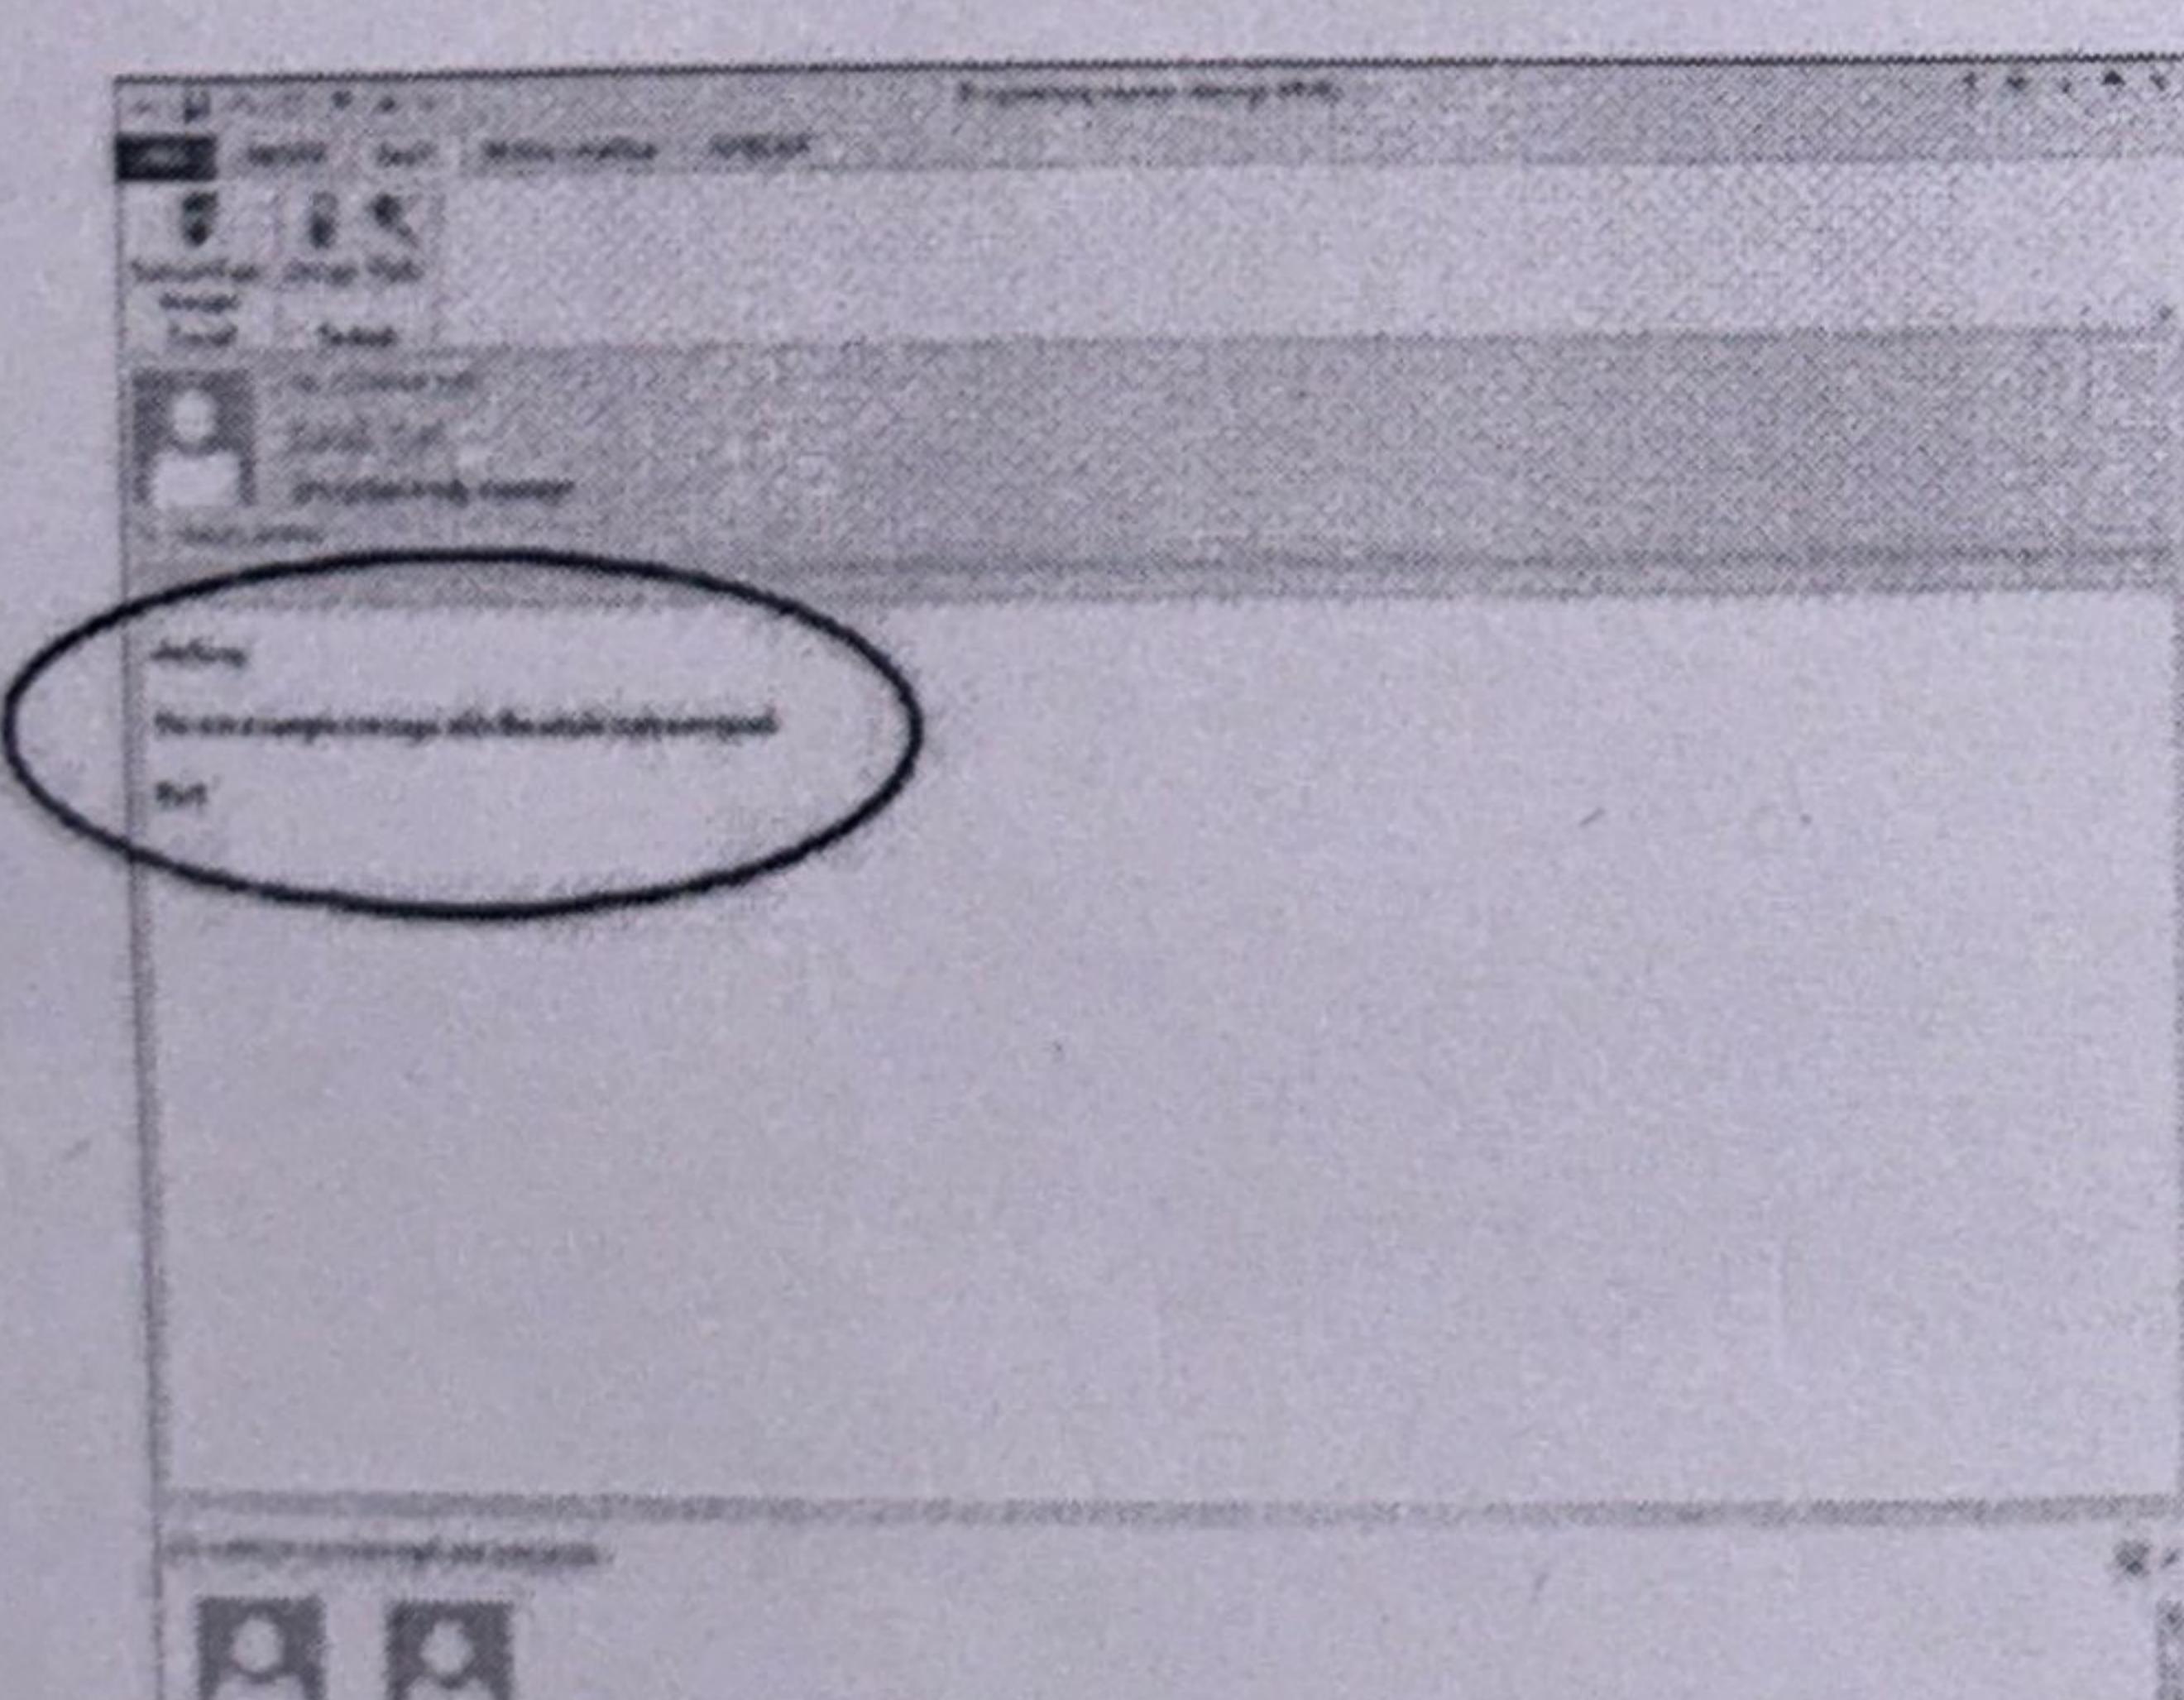

Teacher's Signature:

Selecting decryption ↓

entering Passphrase
and confirming decryption

Decrypting an encrypted email that's sent to you:

- 1 Open email msg
- 2 OpenGL tab
- 3 Click decrypt button
- 4 In cmd, enter private passphrase
- 5 Enter passphrase, click ok
- 6 Result window shows status of decryption
Click on Finish
- 7 Your encryption mail msg will be displayed
- 8 Close mail and click no, Email will remain encrypted

Result

Kleopatra tool Demonstration is Completed Successfully

The screenshot shows the PyCharm IDE interface with two files open: `network_speed_test.py` and `pass.py`. The `pass.py` file contains the following code:

```
def check_password_strength(password):
    if len(password) < 8:
        return "Weak: Password should be at least 8 characters long."
    if not re.search(pattern=r'[a-z]', password):
        return "Weak: Password should contain at least one lowercase letter."
    if not re.search(pattern=r'[A-Z]', password):
        return "Weak: Password should contain at least one uppercase letter."
    if not re.search(pattern=r'\d', password):
        return "Weak: Password should contain at least one digit."
    if not re.search(pattern=r'[^QWERTYUIOPqwertyuiop]+', password):
        return "Weak: Password should contain at least one special character."
    return "Strong: Password meets the criteria for strength."
```

A terminal window below shows the command `python pass.py` being run, followed by an input prompt for a password. The output indicates the password is strong.

```
C:\Users\peshw\PycharmProjects\SPEEDTEST\venv\Scripts\python.exe C:\Users\peshw\PycharmProjects\SPEEDTEST\pass.py
Enter a password to test: P@ssw0rd
Strong: Password meets the criteria for strength.

Process finished with exit code 0
```

Password is input & confirming result

Aim

To check the strength of "user input" password

Program

`import re`

```

def password check_password_strength(password):
    if len(password) < 8:
        return "weak: atleast 8 char is to be present"
    if not re.search(pattern: r'[a-z]', password):
        return "weak: atleast 1 lowercase is must"
    if not re.search(pattern: r'[A-Z]', password):
        return "weak: atleast 1 uppercase is must"
    if not re.search(pattern: r'\d', password):
        return "weak: atleast 1 digit is must"
    if not re.search(pattern: r'[@#$%^&*()_+]', password):
        return "weak: atleast one special character is must"
    return "Strong Password, criteria is met"

```

```

if __name__ == "__main__":
    password = input("Enter password to test")
    result = check_password_strength(password)
    print(result)

```

Result

Password Strength testing tool implemented successfully
